(6) *Bill of Exceptions*: A bill of the nature of an appeal from a judge who is held to have misstated the law, whether by ignorance, by inadvertence, or by design. This the judge is bound to seal if he be requested by the counsel on either side so to do. Now few *bills of exceptions* are given in, the practice of asking for a new trial having become very prevalent. (*Blackstone: Comment.*: bk. iii. ch. 23.)

(7) *Bill of Indemnity*: An Act of Parliament passed each session to grant indemnity to those who have not taken the oaths requisite on entering certain situations.

(8) *Bill of Indictment*: A written accusation made against one or more persons of having committed a specified crime or misdemeanour. It is preferred to and presented on oath by a grand jury. If the grand jury find the allegations unproved, they ignore the bill, giving as their verdict "Not a true bill," or "Not found a true bill;" if, on the contrary, they consider the indictment proved, their verdict is a "True bill" in barbarous legal Latin "vitta vera." (*Blackstone: Comment.*, bk. iv., ch. 23.)

(9) *Bill of Middlesex* (from the county of Middlesex, where the Court of King's or Queen's Bench sits): A kind of *capias* directed by the Court of Queen's Bench to the sheriff of a county directing him to bring thence a certain defendant and deliver him at Westminster to answer to a plea of trespass. The words *ac etiam* then brought him into the jurisdiction of the court on some other charge. [*AC ETIAM.*] (*Blackstone: Comment.*, bk. iii., ch. 19.) The fictitious charge of trespass was swept away by 2 Will. IV. c. 39, and personal actions in the several divisions of the High Court of Justice are now commenced by *announcements*.

(10) *Bill of Pains and Penalties*: A bill inflicting pains and penalties (short however of capital punishment) on persons supposed to be guilty of treason or felony, even though not judicially convicted of these crimes.

(11) *Bill of Particulars*: A paper stating a plaintiff's case, or the set-off on defendant's side.

(14) *Bill of Rights*. [II. Hist.]

3. *Scots Law*: Every summary application by way of petition to the Court of Session. *Spec.*—

(1) *Bill of advocacy to Court of Justiciary*: An application to the Commissioners of Justiciary praying that the proceedings of an inferior court in a criminal case may be advocated or brought for review to the Court of Session.

(2) *Bills of Signet letters*: Warrants authorizing the keeper of the king's signet to affix it to certain writs.

(3) *Bills of suspension of Court of Justiciary*: An application to the Lords of Justiciary praying them to suspend or stay the execution of a sentence passed in an inferior court in a criminal case.

II. *History and Law. Bill of Rights*: A bill which gave legal validity to the "claim of rights," i.e., the declaration presented by the Lords and Commons to the Prince and Princess of Orange on the 13th February, 1688, and afterwards enacted in Parliament when they became king and queen. It declared it illegal, without the sanction of Parliament, to suspend or dispense with laws, to erect commission courts, to levy money for the use of the crown, on pretence of prerogative, and to raise and maintain a standing army in the time of peace. It also declared that subjects have a right to petition the king, and, if Protestants, to carry arms for defence; also that members of Parliament ought to be freely elected, and that their proceedings ought not to be impeached or questioned in any place out of Parliament. It further enacted that excessive bail ought not to be required, or excessive fines imposed, or unusual punishment inflicted; that juries should be chosen without partiality; that all grants and promises of fines or forfeitures before conviction are illegal; and that, for redress of grievances and preserving of the laws, Parliament ought to be held frequently. Finally, it provided for the settlement of the crown.

III. *Parliamentary Procedure & Law*: A draft of a proposed Act of Parliament, which, if it successfully pass the House of Commons and of Lords, and obtain the royal assent, will become law, but which will almost certainly undergo some modifications in its passage through the House, and may ultimately prove abortive. The classification of such bills is into *private* and *public*. If the relief sought be of a private nature, then the House must be approached by petition; this is generally referred to a committee to report on the facts. Only in the event of this report being favourable is leave given to introduce a bill. A private bill is not printed or published among the other laws of the session. Relief has been granted against it when it has been obtained by a fraudulent statement of facts. No judge or jury is bound to take notice of it, unless it be specially set forth and pleaded before them. It remains, however, enrolled among the public records of the nation. (*Blackstone: Comment.*, bk. ii., ch. 21.)

Formerly, public bills also were drawn in the form of petitions, but since the reign of Henry VI. they have been skeletons of bills in Act of Parliament form, with blanks for modifications. To pass into law, a bill must be read three times in each House of Parliament, with intervals between each reading. After the second reading, which is supposed to settle the general principle, it is referred to a committee, which, if the matter is to be discussed, may be of the whole house. [COMMITTEE.] Then the third reading of it takes place. If it has commenced, as most bills now do, in the Commons, it is then sent up to the House of Lords to undergo the same processes there. If it began in the House of Lords it is similarly sent down to the Commons. If when a bill has gone from the Lower to the Upper House, amendments are proposed upon it by the Lords, these are sent back to the Commons for reconsideration. If the Commons assent to these amendments, the bill is sent back to the Lords to pass. In important bills, when

the two houses cannot come to an agreement about the amendments, a conference may take place between them. Money bills cannot be altered by the House of Lords. If a bill fail at any of the stages of its progress it cannot be reintroduced again the same session. When a bill has passed through both Houses of Parliament it then, almost as a matter of course, receives the royal assent [ASSENT], after which it is called an Act of Parliament. This statement applies also to the procedure in the American Congress and Legislatures.

IV. *Comm. & Law*: A writing in which one man is bound to another to pay a sum of money on a future day or presently on demand, according to the agreement of the parties at the time when it is drawn; and on which, in the event of failure, execution may be summarily done to enforce payment.

(1) *Bank bill*. [BANK-BILL.]

(2) *Bill of Adventure*: A writing signed by a merchant, in which he states that certain goods shipped in his name really belong to another person, at whose risk the adventure is made.

(3) *Bill of Credit*:

(a) *Among merchants*: A letter sent by an agent or other person to a merchant, desiring him to give the bearer credit for goods or money. It is frequently given to one about to travel abroad, and empowers him to take up money from the foreign correspondents of the person from whom the bill or letter of credit was received.

(b) *Among governments*: A paper issued by a government on its credit, and designed to circulate as money.

"... of bills of credit issued from the Exchequer."—*Blackstone: Comment.*, bk. iv., ch. 17.

¶ By the constitution of the United States it is provided that no state shall issue bills of credit.

(4) *Bill of debt*: A bill acknowledging a debt, and promising to meet it at a specified time. It is called also a *bill obligatory*.

(5) *Bill of Entry*: A written account of goods entered at the custom-house, whether imported or designed for exportation.

(6) *Bill of Exchange*: A bill or security originally introduced for enabling a merchant in one country to remit money to a correspondent in the other. It is an open letter of request from one man to another desiring him to pay to a third party a specified sum and put it to account of the first. If A in London owe £500 to B in Melbourne (Australia), and C be about to travel from Melbourne to London, then C may pay the £500 to B before departure, and carry a bill of exchange on A in London for the amount. If the last-named gentleman be honest, and if he be solvent, he will repay the money to C on reaching London, and C will have reaped an advantage in having the cash in the form of a bill, which it was safer for him to carry in this form on the passage than if he had had it in notes or gold. In such a transaction, B, the person who writes the bill of exchange, is called the *drawer*; A, to whom it is written, is termed up to the time that he accepts it, the *drawee*, and after he has done so the *acceptor*; and C, his order, or the bearer—in short, whoever is entitled to receive the money—the *payee*. The bill may be assigned to another by simple endorsement; the person who thus transfers it is named the *endorser*, and the one to whom it is assigned the *endorsee* or holder. Every one whose name is on the back of a bill is responsible if the person on whom payment should legitimately fall fail to meet his engagement. The first bills known in England were about A. D. 1328. Bills of exchange are sometimes called *drafts*. Formerly it was deemed important to divide them into *foreign*, when they were drawn by a merchant residing abroad or his correspondent in England, and *inland* when both the drawer and the drawee reside within the kingdom. Now, the distinction is little attended to, there being no legal difference between the two classes of bills.

(7) *Bill of Lading*: A document by which the master of a ship acknowledges to have received on board his vessel in good order and condition certain specified goods consigned to him by some particular shipper, and binds himself to deliver them in similarly good order

and condition—unless the dangers of the sea, fire, or enemies prevent him—to the assignee of the shipper at the point of destination, on their paying him the stipulated freight. Usually two or three copies of a bill of lading are made, worded thus: "One of which bills being accomplished, the other stands void." A bill of lading may be transferred by endorsement like a bill of exchange.

(8) *Bill of Parcels*: An account given by a seller to a buyer, giving a list of the several articles which he has purchased and their prices.

(9) *Bill of Sale*:

(a) *In England*: A deed or writing under seal designed to furnish evidence of the sale of personal property. If it is necessary to have such an instrument when the sale of property is not to be immediately followed by its transfer to the purchaser. It is used in the transfer of property in ships, in that of stock in trade, or the goodwill of a business. It is employed also in the sale of furniture, the removal of which from the house would call attention to the embarrassed circumstances of its owner; hence the statistics of the bills of sale act as an index to measure the amount of secret distress existing in times of commercial depression. In not a few cases *bills of sale* are used to defeat just claims against the nominal or real vendor of the goods transferred.

(b) *In the United States*: A writing given by the seller of personal property to the purchaser, answering to a deed of real estate, but without seal.

(10) *Bill of Sight*: A form of entry at the custom-house by which one can land for inspection, in presence of the officers, such goods as he has not had the opportunity of previously examining, and which, consequently, he cannot accurately describe.

V. *Statistics. Bill of Mortality*: A statistical report of the number of deaths within a certain locality in a year or other specified period of time. To make the figures as useful as possible for scientific purposes, the causes of death are now specified. Bills of mortality for London were first issued during the ravages of a plague in 1592. After an interval they were resumed during another visitation of plague in 1693, and have been published weekly from that time till now.

**Binary arithmetic**: A method of notation invented by Leibnitz, but which appears to have been in use in China about 4,000 years ago. As the term binary implies, there are only two characters in this notation, these are 1 and 0. By it, our 1 is noted by 1, our 2 by 10, 3 by 11, 4 by 100, 5 by 101, 6 by 110, 7 by 111, 8 by 1000, 9 by 1001, 10 by 1010, &c. The principle is that 0 multiplies by 2 in place of by 10, as on the common system. Some properties of numbers may be more simply presented on this plan than on the common one; but the number of places of figures required to express a sum of any magnitude is a fatal objection to its use. Indeed, Leibnitz himself did not recommend it for practical adoption.

**Binary compound**:

Chem.: A compound of two elements, or of an element and a compound performing the function of an element, or of two compounds performing the functions of elements.

"Among the secondary organic products of the vegetable class we meet a few instances of binary compounds of simple elements."—Todd & Bowman: *Physiolog. Anat.*, Vol. I. (Introd.), p. 8.

**Binary engine**: Usually an engine having one cylinder, the piston being impelled by steam, which, having done its work there, is exhausted into another part of the apparatus, where it is allowed to communicate its unutilised heat to some liquid volatile at a lower temperature; the vapour of this second liquid, by its expansion in a second cylinder, yields additional useful force. Ether, chloroform, and bisulphide of carbon, have all been tried. (Knight.)

**Binary form**:

Music: The form of a movement which is founded on two principal themes or subjects. [SONATA FORM.] (Steiner & Barrett.)

**Binary logarithms**: A system of logarithms devised by Euler for facilitating musical calculations. Instead of having, like the common system of logarithms, 1 as the logarithm of 10, and 43,429,448 as the modulus, it had 1 as the logarithm of 2, and the modulus 1,442,695.

**Binary measure**: Common time, that is, in which the time of rising is equal to that of falling. [TONE SOL-FA.]

**Binary number**: A number composed of two units.

**Binary scale**:

Arith.: A uniform scale of notation, the ratio of which is two.

**Binary star**: A star which, closely examined by the telescope, is found to consist of two stars revolving around their common centre of gravity. In some cases they are coloured differently from each other. In 1803 Sir William Herschel discovered that  $\gamma$  Leonie,  $\epsilon$  Bootis,  $\zeta$  Herculis,  $\delta$  Serpentina, and  $\gamma$  Virginia are revolving double stars, and others, including Castor, have since been added to the list. The period of revolution in various cases has been determined. It is found to vary from 43 to 1,200 years.

**Binary system**:

Zool., &c.: A system of classification by which each sub-kingdom, class, order, &c., is perpetually divided into two, the one with a positive and the other with a negative character, till genera are reached. For instance, on this system, the animal sub-kingdom is divided into Vertebrata and Invertebrata, that is, animals which have, and animals which have not, vertebrae. The first is a natural combination; the second is not so, for several of its more or less subordinate sections, such as Articulata, Mollusca, &c., are as distinct from each other as the Vertebrata are from the Invertebrata in general. The Rev. Prof. Fleming was the great advocate of the Binary or Dichotomous system, which he carried out in his "Philosophy of Zoology" and his "British Animals," whilst Swainson, one of the great apostles of the rival Quinary system, was its determined foe.

"Binary or dichotomous systems, although regulated by a principle, are amongst the most artificial arrangements that have been ever invented."—Swainson: *Geog. Class. of Animals*, 9250.

**Binary theory**:

Chem.: A hypothesis proposed by Davy to reduce the haloid salts (as NaCl) and the oxygen salts (as NaNO<sub>3</sub>) to the same type, the monad Cl being replaced by the monad radical containing oxygen (NO<sub>2</sub>). Acids are hydrogen salts, as HCl, or H(NO<sub>2</sub>). A radical is only part of a molecule which can unite with or replace a molecule or another radical, atomically for atomically. Thus the dyad radical (SO<sub>2</sub>) can replace two monad radicals, (NO<sub>2</sub>)<sub>2</sub>, as in the equation Pb<sup>(NO<sub>2</sub>)<sub>2</sub></sup> + Mg<sup>(SO<sub>2</sub>)</sup> = Pb<sup>(SO<sub>2</sub>)</sup> + Mg<sup>(NO<sub>2</sub>)<sub>2</sub></sup>. A radical cannot exist in a separate state. [SEE RADICAL.]

¶ (a) Crabb thus distinguishes the verbs to bind and to tie:—"Binding is performed by circumvolution round a body; tying, by involution within itself. Some bodies are bound without being tied; others are tied without being bound; a wounded leg is bound but not tied; a string is tied but not bound; a riband may sometimes be bound round the head, and tied under the chin. Binding therefore serves to keep several things in a compact form together; tying may serve to prevent one single body separating from another; a criminal is bound hand and foot; he is tied to a stake." "Binding and tying likewise differ in degree; binding serves to produce adhesion in all the parts of a body; tying only to produce contact in a single part." Similarly, in the figurative use of the terms, a bond of union is applicable to a large body with many component parts; a tie of affection marks an adhesion between individual minds.

(b) *To bind, to oblige, and to engage* are thus discriminated:—"Bind is more forcible and coercive than oblige; oblige than engage. We are bound by an oath, obliged by circumstances, and engaged by promises. Conscience binds, prudence or necessity oblige, honour and principle engage. A parent is bound no less by the law of his conscience, than by those of the community to which he belongs, to provide for his helpless offspring. Politeness obliges men of the world to preserve a friendly exterior towards those for whom they have no regard. When we are engaged in the service of our king and country, we cannot shrink from our duty without exposing ourselves to the infamy of all the world." "A debtor is bound to pay by virtue of a written instrument in law; he is obliged to pay in consequence of the importunate demands of the creditor; he is engaged to pay in consequence of a promise given. A bond is the strictest deed in law; an obligation binds under pain of a pecuniary loss; an engagement is mostly verbal, and rests entirely on the rectitude of the parties." (Crabb: *English Synon.*)

**Nomenclature of Animals, Plants, &c.:** A system (that which now obtains), which gives to an animal, a plant, or other natural object, two names, the first to indicate the genus and the second the species to which it belongs, as *Canis familiaris* (the dog), *Bellis perennis* (the daisy).

"This system [of zoological nomenclature] is called the *binomial system* from the circumstance that, according to this method, every animal receives two names, one belonging to itself exclusively, the other in common with all the other species of the genus in which it is included."—*Dallas: Nat. Hist. & Anim. King.* p. 11.

**binomial theorem**.

**Algebra:** A theorem, or it may be called a law, discovered by Sir Isaac Newton, by which a binomial quantity can be raised to any power without the trouble of a series of actual multiplications. Actual multiplication shows that the 7th power of  $x + a$  is  $x^7 + 7x^6a + 21x^5a^2 + 35x^4a^3 + 35x^3a^4 + 21x^2a^5 + 7xa^6 + a^7$ . It is evident that the several powers of the two letters  $x$  and  $a$  and the co-efficients stand so related to each other that study of them might enable one to deduce a law from

them. In its most abstract form it is this:—If  $(x + a)$  be raised to the  $n$ th power, that is,  $(x + a)^n$ . It is  $x^n + nx^{n-1}a + \frac{n \cdot (n-1)}{1 \cdot 2} x^{n-2}a^2 + \frac{n \cdot (n-1) \cdot (n-2)}{1 \cdot 2 \cdot 3} x^{n-3}a^3 + \dots$  &c

**bi-ô-gra-phôe'**, s. [BIOGRAPHY.] The subject of a biography.

all from Gr. βίος (bios) = the time or course of life, life, and γραφή (graphē) = to write.] [BIOGRAPHY.] One who writes the lives or memoirs of persons deceased.

¶ It is used—

(1) As a simple word:

"... that industrious and exact antiquary and biographer, Mr. Anthony à Wood, . . ."—Wood: *Athenæ Oxon. & Biographer to the Reader.*

(2) In compos.: In the term *autobiographer* = one who is a biographer of himself, i.e., who writes his own life or memoirs. [AUTOBIOGRAPHER.]

\* bi-ō-grāph'-ī-a, s. [BIOGRAPHY.]

† bi-ō-grāph'-īc, bi-ō-grāph'-ī-cal, a. [In Fr. *biographique*; Port. *biográfico*; from Gr. βίος (bios) = course of life, and γραφικός (graphikos) = capable of drawing, painting, or writing.] Pertaining to biography. [BIOGRAPHY.]

"The short *biographical* notices which were inscribed under the ancestral names were doubtless in many cases derived from an early date."—Lewis: *Soc. Rom. Hist.*, ch. vi., § 2, vol. I, p. 18.

bi-ō-grāph'-ī-cal-ly, adv. [Eng. *biographical*; -ly.] After the manner of biography or of a biographer. (Ec. Rev.)

bi-ōg'-ra-phīe, v. t. [*Biograph(y)*, term. -ise.] To write the life of a person.

"As a Latin poet, I *biographise* him."—Southey: *Letters*, I, 115.

bi-ōg'-ra-phŷ, \* bi-ō-grāph'-ī-a, s. [In Ger. & Fr. *biographie*; Port. *biographia*; Ital. & Sp. *biografía*. From Gr. βίος (bios) = course of life such as man leads, as opposed to ζωή (zōē), that led by the inferior animals. βίος (bios) is used also to mean biography. *Graphy* is from Gr. γραφή (graphē) = a delineation, a writing, a description; γραφω (graphō) = to grave, to write.] The written life of an eminent person. It is supposed to be fuller than memoirs, which simply record the more memorable scenes in his history. The word *biography* is quite recent. As French shows, it came into the language first as *biographia*. This latter term, though it looks Greek, or Latin borrowed from Greek, is really in neither tongue, though it occurs in Portuguese, and analogous words exist in French, Italian, and Spanish. [See *stym.*] Though the term *biography* is modern, the kind of literature which it describes is ancient. In the book of Genesis there are biographies, or at least memoirs, of Adam, Noah, Abraham, Isaac, Jacob, Joseph, and others. Homer's "Odyssey" may be considered to be an extended biography of Odysseus, limited, however, to the most interesting period of his life—that of his wanderings. Though the Trojan war, yet, more accurately, it is a chapter from the biography of Achilles, describing calamities brought upon the Greeks by the revenge which he took on Agamemnon for carrying off his female captive, Briseida. The most elaborate ancient Greek biography was Plutarch's *Parallel Lives*, βίαι Παράλληλοι (*Bioi Paralleloi*), consisting of forty-six memoirs of Greek, Roman, and other celebrities; it was published about A.D. 80. In B.C. 44, Cornelius Nepos had sent forth a biographical work, his *Vitæ Imperatorum*, *Lives of Commanders*.

In more modern times very extended biographies have been attempted. Thus France has its *Biographie Universelle* in fifty-two volumes, published between 1810 and 1828, and England, among other works, possesses its *Biographia Britannica* (five volumes) (1747-1768), its *English General Biographical Dictionary*, eleven volumes (1782), and *Chalmers's Biographical Dictionary*, thirty-two volumes (1817-1817), and the great *Dictionary of National Biography* (commenced in 1885, and planned to make fifty volumes). Among works of more limited aim may be noted various *Lives of the Saints*, Foxe's *Book of Martyrs*, various *Lives of the Poets*, Boswell's *Life of Johnson*, and finally *Men of the Time*, in which last work are memoirs of living instead of dead heroes.

One branch of biography is *autobiography*, in which a person gives his own life or memoirs. *Cæsar's Commentaries* is a most valuable example of this kind of writing. *Biography* is properly a department of history which, as Macaulay shows, should be a history not solely of kings or similar personages, but of the people also over whom they

rule. The more prominent a person has been, the more nearly does his biography become identical with history in the ordinary sense. A life or memoir of Martin Luther, Napoleon I., or the first Duke of Wellington, is in all essential particulars history, and that not of a solitary nation, but of Europe, nay, even of the world.

¶ *Biography* is used—

(1) As a simple word.

"*Biographia*, or the history of particular men's lives, comes next to be considered."—Dryden.

"... so species of writing seems more worthy of cultivation than *biography*, since poets can more certainly enchain the heart by irresistible interest, or more widely diffuse instruction to every diversity of condition."—Johnson: *Rambler*, No. 60.

(2) As a compound, in the term *autobiography* (q.v.).

bi-ō-lōg'-ī-cal, a. [In Fr. *biologique*; from Gr. βίος (bios) = course of life, and λογικός (logikos) = pertaining to speech or reason; λόγος (logos) = a word, . . . a discourse; suff. -al.]

*Phys. Science*: Pertaining or relating to the science of biology.

"The state of *biological science*."—Dr. Allen Thomson: *Brit. Assoc. Rep.* (1871), pt. II, 114.

bi-ō-lōg'-īc-al-ly, adv. [Eng. *biological*; -ly.] In a biological manner.

bi-ōl'-ō-gist, s. [Gr. βίος (bios) = course of life, and λογιστής (logistēs) = a calculator, a reasoner; λογίζομαι (logizomai) = to count, reckon.]

*Phys. Science*: One who cultivates the science of biology.

"... the problems and arguments familiar to the professed *biologist*."—Prof. Rolleston: *Brit. Assoc. Rep.* (1870), pt. II, 92.

bi-ōl'-ō-gŷ, s. [In Fr. *biologie*; from Gr. βίος (bios) = course of life (BIOGRAPHY), and λόγος (logos) = . . . discourse.]

*Phys. Science*: A term, first introduced by Treviranus of Bremen, recently adopted by the leading British naturalists, and now obtaining universal currency. It is used in two senses—

(1) (In a more restricted sense): *Physiology*.

"... the word *biology* is at present used in two senses, the one wider, the other more restricted. In this latter sense the word becomes equivalent to the older and still more currently used word 'Physiology'."—Prof. Rolleston: *Brit. Assoc. Rep.* (1870), pt. II, 92.

(2) (In a wider sense): The science of life in its widest acceptance. It specially addresses itself to scientific inquiries into the first origin of life and the changes it has undergone from the earliest traceable period until now. There has been since the year 1865 or 1866 a section of the British Association termed *Biology*, and a similar section in the American Association. It is divided into three departments (formerly called sub-sections), the first named *Zoology* and *Botany*, the second *Anthropology*, and the third *Anatomy* and *Physiology*.

"It is in the wider sense that the word is used when speaking of this as being the section of *Biology*; and this wider sense is a very wide one, for it comprehends first animal and vegetable physiology and anatomy; secondly, ethology and anthropology; and, thirdly, scientific zoology and classificatory botany, inclusively of the distribution of species."—Prof. Rolleston: *Brit. Assoc. Rep.* (1870), pt. II, 92.

bi-ō-phŷ-tūm, s. [Gr. βίος (bios) = life, and φυτόν (phuton) = a plant, φύω (phuō) = to bring forth.]

*Bot.*: A genus of plants belonging to the order Oxalidaceæ (Oxalida). The *Biophytum sensitivum* (Sensitive Biophytum) has pinnated leaves, irritable or sensitive. It is a very pretty annual.

bi-ō-plāsm, s. [Gr. βίος (bios) = life, course of life, and πλάσμα (plasma) = that which is capable of being fashioned, an image; from πλάσσω (plassō) = to form, mould, or shape.]

*Bot.*: A term introduced by Prof. Lionel S. Beale, M.B., F.R.S., to designate forming, living, or germinal matter; the living matter of living beings. The term protoplasm had been previously used in an analogous sense, but Dr. Beale felt precluded from adopting it by the fact that it was used by most writers, and notably by Professor Huxley, in a widely extended sense, so as to require the introduction of a word more limited in signification. It is distinguished from formed matter; indeed, the extension of the one and that of the other occur under different and often opposite conditions. All the organs of the body come from bioplasm. (Beale: *Bioplasm*, 1872.)

bi-ō-plāst, s. [Gr. βίος (bios) = course of life, and πλαστός (plastos) = formed, moulded; from πλάσσω (plassō) = to form, to mould.]

*Bot.*: A little nucleus of germinal matter, many of which are scattered through the tissues of the body. It is from these that the growth of new matter proceeds. In the process of healing of a wound near the surface of the body, "lymph" is poured out, in which may be found bioplasts which have descended from white blood corpuscles. Of these, some produce epithelium, others fibrous connective tissue, unless they be too freely nourished, in which case they grow and multiply rapidly, and no kind of tissue whatever results, but pus is alone formed. (Beale: *Bioplasm*, § 43, 133.)

bi-ōsō'-ō-py, s. The diagnosis of life and death, as by means of an electric current.

bi-ō-tine, bi-ō-tī-na, s. [Ital. *biotina*. From *Biot*, a French naturalist.] A mineral called also Anorthite (q.v.).

bi-ō-tite, s. [Named after *Biot*, a French naturalist; suffix -ite.]

*Mfn.*: A hexagonal and an optically uniaxial mineral, formerly called Magnesia Mica, Hexagonal Mica, and Uoiaxial Mica. It exists in tabular prisms, in disseminated scales, or in massive aggregations of cleavable scales. Colour: silvery-white, rarely bottle-green, and by transmitted light, often fiery-red. Composition a good deal varies. One specimen had silica, 40.00; alumina, 16.16; sesquioxide of iron, 7.50; oxide of manganese, 21.54; potassa, 10.83; water, 3.0; iron, 0.50; and titanica acid, 0.2. Rubellan is an altered biotite and Eukamptite one of a hydrous type. (Dana.)

bi-par-tī-ble, a. [In Fr. *bi-partible*. From Lat. *bi-partitio* = to divide into two parts. Lat. pref. *bi* = two, and *partitile* = divisible; *partio* = to share, to part; *pars* = a part.]

*Bot.*: Capable of being parted in two. Example: the Calyx of *Protea*.

A. As substantive:

1. The English name of the trees and shrubs belonging to the botanical genus *Betula* (q.v.). Two species occur wild in Britain, the Common Birch (*Betula alba*) and the Dwarf Birch (*B. nana*). The Common Birch has ovate-deltoid, scute, doubly serrate leaves. Its flowers are in catkins, which come forth in April and May. It grows best in heathy soils and in alpine districts. The Drooping or Weeping Birch (*B. pendula*) is a variety of this tree. It grows wild on the European continent and in Asia. The wood of the birch is tough and white. It is used for making brooms; it is often burned into charcoal; twigs are by many employed for purposes of castigation. The oil obtained from the white rind is used in tanning Russia leather. [BIRCH-OL.] The Russians burn it to account also as a vermifuge and as a balsam in the cure of wounds. In some countries the bark of the birch is made into hats and drinking-cups. The *Betula nana*, or Dwarf Birch, grows in the Highlands of Scotland, in Lapland, &c. It is a small shrub, one or two feet high. The Laplander uses the wood for fuel, and the leaves, spread over with a reindeer's skin, for a bed. *B. lenta* is the Mahogany Birch, Mountain Mahogany, Sweet Birch, or Cherry Birch of North America. Its leaves are fragrant, and have been used as a substitute for tea. The Canoe Birch, of which the North American Indians construct their portable canoes, is the *B. papyracea*.

2. A rod of birch used for castigation.

**A.** As *substantive*:

1. *Ordinary Language*:

**L. Literally**:

† (1) *In the Anglo-Saxon sense of the term*: The young of any animal; a brood.

"(a) The young of any feathered flying bird; a chicken.

**II. Technically**:

1. *Zool.*: The English designation of the Aves, the second class of the sub-kingdom Vertebrata, standing between the Mammalia (Mammals) above, and the Reptilia (Reptiles) below. Whilst in their warm blood they are more closely akin to the former than to the latter, they approach the latter rather than the former in various points of anatomical structure, especially in their lower limbs. [ORNITHOSCELIDIA.] They agree also with Reptilia, Amphibia, and Fishes in being oviparous, whilst the Mammalia bring forth their young alive and suckle them for a time. Birds are feathered bipeds, with wings used by all but a few aberrant species for flight. To facilitate this, air cells communicating with the lungs permeate the larger bones, and even the huge bills of the hornbill, toucan, &c., the effect being greatly to diminish their weight. The circulation is rapid, the blood warmer than in other vertebrates, and the energy, consequently, great. A bird consists of a head, a body, and limbs, the latter term including the legs, tail, and wings. In the subjoined figure—

a is the bill. b is the front (frons). c is the crown or summit (vertex). d is the ear. e is the cape of the neck (nucha). f is the back or interocular region. g is the lower back (tergum). h is the rump (suprapubes), where the tail feathers are inserted. i is the tail. j is the legs. k is the wings. l is the belly (abdomen). m is the breast. n is the throat. o is the chin.

¶ For more minute details see BILL, LEG, WING, TAIL, &c.

Linnæus divided Birds into six orders, Accipitres, Picæ, Anseres, Gallinæ, Gallinæ, and Passeres. All of these, except Picæ, are still retained under different names. Cuvier, in 1817, recognised six orders, Accipitres, Passeres, Scansores, Gallinæ, Gallinæ, and Palmipedes. Vigors, in 1825, adopted the quinary arrangement into Raptores, Inasasores, Rasores, Gallatores, and Natatores. Owen, in 1866, made seven orders: Natatores, Gallatores, Rasores, Cantatores, Volitores, and Raptores; and Huxley, in 1864, separated Birds into Saruurores, containing only the Archaeopteryx; the Ratite, including the Ostrich and its allies; and the Carinata, comprehending all ordinary birds. Dallas (following Vogt's arrangement of 1851) divided Birds into two sections, the Antophagi, in which the young birds are capable of feeding themselves from the moment of leaving the egg,

and the Inasasores, in which the young remain in the nest till they are completely fledged, being fed meanwhile by the parents. The former section contains four orders, the Natatores (Swimmers), the Gallatores (Wading Birds), the Rasores (Runners), and the Rasores (Gallinaceous Birds). The Inasasorial section also contains four orders, the Columbe (Pigeons), the Scansores (Climbing Birds), the Passeres (Perchers), and the Raptores (Birds of Prey). In A.D. 1711, Ray estimated the birds known and described at "near 500." In 1835, Mr. Swainson conjectured that the species, known and unknown, might be about 6,800. There are more than 10,000 species of birds, some confined to narrow localities, others widely distributed. Of these, a considerable proportion belong to the United States, either as summer visitors or as yearly residents

2. *Palæont.*: In certain triassic strata in Connecticut there are "ornithichnites," or fossil footprints like those which birds would leave upon the mud or fine sand over which they walked. [FOOTPRINTS, ORNITHICHNITE.] The number of joints in each of the three toes is precisely the same as in modern birds, notwithstanding which some think the imprints may be those of Deinoaurian reptiles, of which remains have been found in the same stratum. The oldest bird, of which the actual feathered skeleton has been obtained, comes from the lithographic slate of upper oolitic age, quarried at Solenhofen in Bavaria: it is the *Archæopteryx* of Owen (q.v.). Three specimens of it are known at present: one in Bavaria, the second in the British Museum of Natural History, South Kensington, whilst the third is in the Berlin University Museum, for which it was purchased from Herr Haberlein for 80,000 marks, or about £4,000. This last specimen of *Archæopteryx* has been examined by Professor Carl Vogt, who considers that it is neither bird nor reptile, but something intermediate between the two; or, to be more specific, that while a bird in its integument and hinder limbs, it is a reptile in all the rest of its organisation. Bones like those of birds exist in the Wealden; opinion has much wavered as to whether they were true birds or flying reptiles [PRERODACTYL]; there is, however, what appears to be a genuine bird in the Greensand. Prof. Marsh found in the Cretaceous rocks of America two remarkable genera of birds: the *Hesperornis* and the *Icthyornis*, the former furnished with true teeth in a groove, and the latter having them lodged in sockets. In these respects they approach reptiles, besides which the *Icthyornis*, like reptiles, has its vertebrae concave at each end. Of tertiary birds Owen, in 1846, established four species from the London clay, described from four or five fragments of bones and skulls found in that scene deposit. These include a vulture, a kingfisher, and an ostrich. Bones of birds have been met with somewhat plentifully in the Paris gypsum and the lacustrine lime stone of the Limagne d'Auvergne, both freshwater strata of eocene age. From the miocene beds of France have been obtained about seventy species, among others, parrots, tringas, flamingoes, secretary birds, and marabout storks, suggesting the present fauna of South Africa. There are birds in the miocene of the Sewalik hills in India. Of post-tertiary species the finest, and also the best known, are the gigantic Moas from New Zealand, which seem to have been contemporary with man, though now they are extinct. The yet more massive *Epyornis*, the eggs of which are more than thirteen inches in diameter, and equal in capacity to 148 hen's eggs, is found in surface deposits in Madagascar. Thus few fossil birds are known, and those few are mostly from the tertiary or post-tertiary rocks.

3. *Her.*: Birds are regarded, some as emblem of the more active, and others of the contemplative life. Among the terms applied to them are Membered, Armed, and Close (q.v.). When birds are mentioned in blazon, without expressing their species, they should be drawn in the form of the blackbird. (*Gloss. of Her.*)

**B.** As *adjective*: Of, belonging to, or for a bird. (See the compounds which follow.)

**C.** In special phrases.

bird-catching, s. & a.

1. As *subst.* : The art, operation, or occupation of catching birds. This is one of the regular callings of the London poor. Among the birds caught are the linnet, the bullfinch, the goldfinch, the

chaffinch, the greenfinch, the lark, the nightingale, &c. Mr. Henry Mayhew calculates that one man, who practised the trade for sixty years, must have caught, first and last, about 312,000 birds. The general method adopted is the employment of a decoy-bird and a net. [*BIRD-NET.*]

Learning to associate the singing with the gradual appearance of light and the exhibition of food, they sing to obtain these necessities. (*Mayhew.*)

the bird, or sprung by a person on watch. The netting of birds by the former method is well pictured in the ancient Egyptian paintings. (*Knight.*) The trap was generally made of net-work, strained over a frame. It consisted of two semi-circular sides or flaps of equal sizes, one or both moving on the common bar or axis upon which they rested. When the trap was set, the two flaps were kept open by means of strings, probably of catgut, which the moment the bait that stood in the centre of the bar was touched, slipped aside, and allowed the two sides to collapse, so thus secured the bird. The Egyptian nets were very similar to those used in Europe at the present day, but probably larger, and requiring a greater number of persons to manage, which may be attributed to an imperfection in their contrivance for closing them.

**Bird's-eye view, Bird-eye view:** A view such as must present itself to a bird flying over a country, and consequently looking at the landscape from above. It is found in Scotland. *O. sativus*, or the Serradilla Bird's-foot, introduced from Portugal about 1818, has proved a most valuable fodder-plant.

"Of the street sellers of bird's-nests."—*Magnow: London Labour, li. 52.*

¶ **Edible bird's-nests** are nests built by the *Collocalia esculenta*, and certain other species of swallows inhabiting Sumatra, Java, China, and some other parts of the East. The nests, which are deemed a luxury by the Chinese, are formed of a mucilaginous substance, secreted by the birds themselves from their salivary glands.

**II. Figuratively and technically:**

1. Either the popular or book-names of several plants.

† (1) The Wild Carrot, *Daucus Carota* (Linn.).

"The whole tuft [of flowers] is drawn together when the seed is ripe, resembling a bird's-nest; whereupon it hath become named of some bird's-nest."—*Gerard: Herbar, 678.*

This plant is so called from having its root composed of numerous fleshy fibres aggregated in a bird's-nest fashion. Gerard indicates the kind of nest which in his view it resembles, saying that it "hath many tangling roots platted or crossed one over another verie intricately, which resembleth a crow's nest made of sticks." It has dingy brown flowers growing in spikes, and is found in the northern parts of Britain.

**birds-of-paradise, s.** The English designation of a family of Conirostral birds—the Paradisee. They are closely allied to the Corvidæ (Crows), with which, indeed, they are united by some writers. They have magnificent plumage, especially the males, who can moreover elevate quite a canopy of plumes behind their necks. When first discovered they were the subject of many myths. They were supposed to be perpetually on the wing, having no feet, a fable perpetuated by Linneus in the name *apoda* or footless, given to the best-known and finest species. The fact was that the inhabitants of New Guinea, their native region, cut off the feet before selling them to Europeans. The fable of the Phoenix is believed to have been framed from myths current about the Birds of Paradise. [PHOENIX.]

**bird's-tare, s.** A name given to a plant, genus *Arachis*.

**bird's-tongue, s.** A name given to various plants:—

1. *Stellaria holostea*. (*Linn.: Ger. Apex.*) Britten and Holland consider the name to have been founded on the shape of the leaves.

The English word twice is cognate with bis. (TWICE.) Bis occurs in composition in a few words, as bissexile. In the form bi, contracted from bis, it is a prefix in many English words, and especially in scientific terms, as bidentate, bipinnate, &c.

A. As substantive: I. Ordinary Language:

1. Gen.: Thin flour-cake which has been baked in the oven until it is highly dried. There are many kinds of biscuits, but the basis of all is flour mixed with water or milk. In fancy biscuits sugar, butter, and flavouring ingredients are used. Plain biscuits are more nutritious than an equal weight of bread, but owing to their hardness and dryness, they should be more thoroughly masticated to ensure their easy digestion. When exposed to moisture, biscuits are apt to lose their brittleness and become mouldy, hence it is necessary to keep them in a dry atmosphere. Digestive biscuits consist almost entirely of bran. Charcoal biscuits contain about ten per cent. of powdered vegetable charcoal. Meat biscuits, which are said to be very nutritious, contain either extract of meat, or lean meat which has been dried and ground to a fine powder. Ground roasted biscuits are sometimes used to adulterate coffee.

"In Greece there is no biscuit . . ."—Lodge: Illustr. Brit. Hist., i. 168. (Richardson.)

"Many have been cured of dropsies by abstinence from drinks, eating dry biscuit, which creates no thirst, and strong frictions four or five times a day."—Arbuthnot on Diet.

2. Spec.: A kind of hard dry bread made to be used at sea. When designed for long voyages it is baked four times. The word biscuit is generally used in the singular as a noun of multitude.

**A. As substantives:**

**I. Of persons:**

**1. New Testament:**

\* (1) A chief priest among the Jews.

"For he wiste that the hlyeste prestis hadden taken hym by envye. But the *bischope* chesedn the peple that he schulde rather leve to ben Barabas . . ." — *Wycliffe* (ed. Purvey): *Mark* xv. 10, 11.

(2) An ecclesiastical functionary in the apostolical churches. There was a plurality of such officers in that at Philippi, their associates in government being deacons, while the "saints," or ordinary Christian members, are mentioned before both (Phil. i. 1). The same officers in the church at Miletus, termed in our version of the N. T. "overseers," are identical with the "elders" of the same ecclesiastical community. [See etymology.] "And from Miletus he sent to Ephesus and called the elders [*πρεσβύτεροι* (*presbuteros*)] of the Church, and . . . said, . . . Take heed, therefore, unto yourselves; and to all the flock over the which the Holy Ghost hath made you [*ἐπίσκοποι* (*episkopos*)] overseers." Or the word might have been rendered, as in other places, "bishops." The term *πρεσβύτερος* (*presbuteros*) was borrowed from the synagogue (ELDER, *PRESBYTER*); etymologically it implied that, as a rule, the person so designated was pretty well advanced in life, whilst *ἐπίσκοπος* (*episkopos*), borrowed from the polity of the Grecian States, pointed to the duty incumbent on him of overseeing the church. The qualifications of a New Testament bishop are given at length by St. Paul (1 Tim. iii. 1-7; Titus i. 7-9), the only other Christian functionary mentioned with him being still the deacon (1 Tim. iii. 8-13.)

2. *Fig.*: Christ viewed as the overseer or spiritual director of the souls of Christians, and as guiding them as a shepherd does his flock.

"For ye were as sheep going astray; but are now returned unto the shepherd and *bishop* of your souls." — 1 Pet. ii. 25.

**II. Church History:**

1. *Post-apostolic period*: A church functionary superior to, and ruling over, the elders or presbyters. Parly among a body of men may exist theoretically, but it cannot in practice be realised. At the deliberations held by the presbyters of Philippi, of Miletus, or other Christian churches, in all probability one of their number was voted into the chair. Times of persecution bring the strongest to the front, and that strong man would, at nearly every crisis, preside over his fellows. He would become their natural leader, and after a time their actual ruler. A distinctive appellation was required to discriminate him from his colleagues, and gradually he monopolised the term *ἐπίσκοπος* (*episkopos*) = overseer or bishop, leaving the humbler designation of *πρεσβύτερος* (*presbuteros*) = presbyters or elders, to his former equals. Such evangelists as Timothy and Titus also exercised functions in many respects identical with those of an episcopate (1 Tim. i. 3; iii. 1; v. 17, 19, 20, 22; 2 Tim. i. 6; ii. 2, 14; iv. 2, 5; Titus i. 5-13; ii. 15.) Finally, the pastor of a church which had a series of village churches to which it had given birth around it, would naturally become overseer of those in charge of these smaller congregations. All these influences tended in favour of episcopacy, which Dr. Lightfoot, late Bishop of Durham, believes to have arisen first in the Jewish Churches, whence between 70 and 100 A. D. it spread to those of Gentile origin, while an inquirer of a totally different school of thought dates the change between 120 and 180. In the writings of Clement, one of the "Apostolic Fathers," the presbyter and bishop are still the same. Polycarp and Hermas speak less decidedly. Ignatius was once studied with passages extolling the episcopate. Most of these have since been discovered to be interpolations, and even the few that remain are not free from suspicion. Omitting various Christian fathers, and proceeding at once to the middle of the third century, the writings of Cyprian, who filled the see of Carthage from A. D. 248 to 255, are full of passages exalting the bishop high over the presbyter, the position claimed for the former being that of successor of the apostles. The views of

Cyprian became those of the church in general. [For further developments see ARCHBISHOP, CARDINAL, POPE.]

2. More modern times: A spiritual overseer ranking beneath an archbishop, and above the priests or presbyters and deacons of his diocese, but his jurisdiction is territorial, not personal. Before a bishop can be consecrated he must be thirty years of age. The Established Church of England is episcopal, and of its bishops twenty-four sit in the House of Lords. They are technically called "lords spiritual," but are not considered "peers of the realm;" they are only "lords of parliament," nor is their dignity hereditary. They rank in precedence below viscounts and above barons. Their style is the Right Rev the Lord Bishop of —, and they are addressed as My Lord. In the United States the office of bishop exists in several church organizations, these being derived directly from the European Churches of the same name. These are the Roman Catholic, the Protestant Episcopal, and the Moravian or United Brethren, all of whom claim direct apostolic succession, and the Methodist Episcopal, which, while making no such claim, has a body of bishops as superintendents of the general clergy. The Reformed Episcopalia are a small body of seceders whose bishops have no dioceses or defined jurisdiction. The Church of Rome, the Greek Church, and the Eastern Churches generally, are under bishops. An immense majority of Christians throughout the world regard diocesan episcopacy as of divine institution; and many, attaching high importance to what is termed apostolic succession (q.v.), unchurch any Christian community which refuses to place itself under episcopal supervision, and deny that the orders of any minister are valid who has not been ordained by a bishop. [BISHOPRIC.]

"It is a fact now generally recognized by theologians of all shades of opinion that in the language of the New Testament the same officer in the church is called indifferently 'bishop,' ἐπίσκοπος (episkopos) and 'elder' or 'presbyter' (πρεσβύτερος)." —Lightfoot: Hulsean Prof. of Divinity, Trin. Col., Cambridge, late Bishop of Durham (St. Paul's Epist. to the Philippians, 1863), p. 93.

1. The office of an apostle; an apostolate.

"For it is written in the book of Psalms, Let his habitation be desolate, and let no man dwell therein: and his bishoprick let another take." —Act 1: 20.

¶ The word in Gr. is ἐπισκοπήν (episkopēn). The quotation is from Psalms cxl. 8, where in the Septuagint exactly the same Greek word is used, correctly rendered in our version of the Psalms "office."

2. The diocese or see of a bishop, the territory over which the jurisdiction of a bishop extends. Many of the English bishoprics date back to Anglo-Saxon times. Besides the two Archbishoprics of Canterbury and York, the following thirteen English sees were in existence prior to the Norman Conquest: London, Winchester, Chichester, Rochester, Salisbury, Bath and Wells, Exeter, Worcester, Hereford, Coventry and Lichfield, Lincoln, Norwich and Durham. So were the Bishopric of Man (combined with that of Sodor, from Sudoyrgs = the Southern Isles, the Scand. name for the Hebrides, about 1113) and the Welsh sees of St. Davids (once an archbishopric), Bangor, St. Asaph, and Llandaff. Since then the following English sees have been created: Ely (A.D. 1109), Carlisle (1133), Oxford (1541), Peterborough (1541), Gloucester (1541), Bristol (1541) (the two last since united), Chester (1541), Ripon (1836), Manchester (1838), St. Albans and Truro (1877), and Liverpool (1880). Of all the English sees London, Durham, and Winchester are held to rank highest, and their occupants have always seats in the House of Lords. The Bishop of Sodor and Man, the lowest in point of dignity, never has this privilege; nor do the four bishops who are juniors in point of standing possess it, only twenty-four bishops being entitled to sit at one time in the Upper House, and there being in England twenty-nine sees. In the Church of Ireland, besides two archbishop-

rics, there are ten bishoprics. In the Scottish Episcopal Church there are seven. Connected with the Church of England in the colonies, including India, there are sixty sees, besides at least eight in foreign parts. Within the British Islands, the Roman Catholic Church counts thirteen bishoprics to England, four in Scotland, and twenty-four in Ireland. In the United States there are sixty-eight bishoprics of the Protestant Episcopal and twenty-eight of the Methodist Episcopal Churches. The Roman Catholic Church has a cardinal, thirteen archbishops and seventy-three bishops.

¶ Crabb thus distinguishes between bishopric and diocese:—"Both these words describe the extent of an apiscopal jurisdiction; the first with relation to the person who officiates, the second with relation to the charge. There may, therefore, be a bishopric, either where there are many dioceses or no diocese; but according to the import of the term, there is properly no diocese where there is not a bishopric. When the jurisdiction is merely titular, as in countries where the catholic religion is not recognised, it is a bishopric, but not a diocese. On the other hand, the bishopric of Rome or that of an archbishop, comprehends all the dioceses of the subordinate bishoprics." (Crabb: Eng. Synon.)

bish-öps-wört, s. [Eng. bishop's; wort.] The name of two plants.

**bis-múth, s.** [In Dan., Fr., & Port. *bismuth*; Sw. & Ital. *bismutte*; Mod. Lat. *bismuthum, vismuthum*; Ger. *wismuth*. Ultimate etym. unknown.]

*I. Chem.*: A triad metallic element, rarely pentad At. Wt. 210. Symb. Bi<sup>m</sup>. Bismuth occurs native along with quartz, and is separated by fusion; it is dissolved in nitric acid, and a large quantity of water added, which precipitates basic bismuth nitrate; this is fused with pure charcoal, which reduces it to the metallic state. Bismuth is a crystalline, hard, brittle, diamagnetic, reddish-white metal, sp. gr. 9.9, melting at 264°C., and expanding on solidifying. It is permanent in the air, but oxidises into Bi<sup>m</sup>2O<sub>3</sub> at red-heat burning with a blue flame. Powdered bismuth takes fire in chlorine gas forming BiCl<sub>3</sub>. Bismuth is easily dissolved by nitric acid; hydrochloric acid has little action on it. Boiling sulphuric acid oxidises it with liberation of SO<sub>2</sub>. Bismuth is used to make fusible metal, an alloy of two parts bismuth, one of lead, and one of tin; it melts at 93°C. Bismuth forms a dioxide Bi<sup>m</sup>2O<sub>3</sub>, a trioxide Bi<sup>m</sup>2O<sub>3</sub>, and a pentoxide Bi<sub>2</sub>O<sub>5</sub>. The so-called tetroxide Bi<sub>2</sub>O<sub>4</sub> is said to be a compound of the last two oxides. Bismuth forms one chloride Bi<sup>m</sup>Cl<sub>3</sub> *bismuthous chloride* (q.v.). Bismuth salts are precipitated by H<sub>2</sub>S from an acid solution (see *Analysis*). They may be separated from the other metals of that group thus: the precipitate of sulphides is washed, and then treated with (NH<sub>4</sub>)<sub>2</sub>S ammonium sulphide, which dissolves the sulphides of arsenic, antimony and tin; the residue is washed, and then boiled with nitric acid, which dissolves all the sulphides except mer-

curic sulphide HgS. The solution is then evaporated with sulphuric acid, the lead, if any, separates out as PbSO<sub>4</sub>, then ammonia NH<sub>3</sub>.H<sub>2</sub>O is added in excess, which precipitates the bismuth as Bi<sup>m</sup>(OH)<sub>3</sub>; the copper and cadmium are in the solution. The salts of bismuth give a white precipitate with water if NH<sub>3</sub>.HCl ammonia chloride is first added to convert them into bismuth chloride, and they give a yellow precipitate with K<sub>2</sub>CrO<sub>4</sub>, which is insoluble in KHO, but soluble in nitric acid. They are reduced on charcoal by the blowpipe-flame, yielding a brittle metallic bead, and give a slight yellow incrustation of oxide.

*2. Min. Bismuth, Native Bismuth*: A scintill and brittle mineral occurring in hexagonal crystals, or reticulated, arborescent, foliated, or granular. The hardness is 2.25; the sp. gr., 9.727; the lustre metallic, the streak and colour of a specimen silvery-white with a reddish tinge. Composition, bismuth 99.914, with traces of tellurium and iron. It occurs, with other metals, in veins in gneiss, clay-slate, and other metamorphic rocks. It has been found in several counties of England, in the silver and cobalt mines of Saxony, in Bohemia, in Norway, Sweden, and in Virginia, North and South Carolina, California, and several other of our Western States.

*3. Pharm.*: Subnitrate of Bismuth, Carbonate of Bismuth, and Oxide of Bismuth taken internally act as sedatives on the stomach in dyspepsia and chronic vomiting. They have been also used in epilepsy and in the diarrhoea attending phthisis. Preparations of bismuth are sometimes employed externally as cosmetics, but when a sulphureted gas acts upon them they blacken the face.

It is prepared by passing chlorine through a solution of potash holding Bi<sup>m</sup>2O<sub>3</sub> in suspension; the red precipitate is digested with strong nitric acid to remove any Bi<sub>2</sub>O<sub>3</sub>. The bright red powder is bismuthic acid BiBO<sub>3</sub>; this when heated to 120°C is converted into Bi<sub>2</sub>O<sub>5</sub>, which is a dull red powder; when strongly heated it gives off oxygen, and forms bismuth tetroxide or bismuthous bismuthite Bi<sub>2</sub>O<sub>3</sub>Bi<sub>2</sub>O<sub>5</sub>.

**bis-múth-id, s.** [Eng., &c., *bismuth*, and

*Min.*: An opaque orthorhombic mineral, in acicular crystals or massive foliated or fibrous. The hardness is 2; the sp. gr., 6.4–7.2; the lustre metallic, with a lead-grey streak and colour. Composition: sulphur, 13.19–19.61; bismuth, 74.55–86.96 or more. It occurs in Cornwall and elsewhere. **bis-múth-óis, a.** [Eng. *bismuth*, and suff. -ous.] Belonging to bismuth.

**bismuthous chloride.**

*Chem.*: Bi<sup>m</sup>Cl<sub>3</sub>, also called *Trichloride of Bismuth*. It is obtained by heating bismuth in chlorine gas, or by distilling the metal with twice its weight of mercuric chloride (HgCl<sub>2</sub>). It is a white hygroscopic substance, melting at 230° and distilling at a higher temperature. It is soluble in dilute HCl, and by the addition of water becomes turbid, Bi<sup>m</sup>OCl, a white powder being formed, which is used as a pigment called "pearl white."

**bismuthous nitrate.**

*Chem.*: Bi<sup>m</sup>(NO<sub>3</sub>)<sub>3</sub>.5H<sub>2</sub>O. It is obtained by dissolving the metal in nitric acid. It crystallises in large transparent prisms. By pouring a solution of this salt into a large quantity of water a white basic nitrate is precipitated. This is used in medicine under the name of *Bismuth subnitras*; it acts as a direct sedative on the mucous membrane of the stomach and intestines. It is given in irritant forms of dyspepsia and chronic vomiting, also to check diarrhoea. It is also largely used as a cosmetic, but it is blackened by sulphureted hydrogen.

**bismuthous oxide.**

*Chem.*: Bi<sup>m</sup>2O<sub>3</sub>, also called *Bismuth Tri-oxide*. Obtained by heating the basic nitrate of bismuth to low redness. It is a yellow insoluble powder. The white hydrate is obtained by precipitating a salt of bismuth by an excess of ammonia.

 2. An analogous species roaming over a great part of North America. [II. 2.]  
 "Worn with the long day's march and the chase of the deer and the bison."  
*Longfellow: Evangeline*, II. 4.

II. *Zool. & Palæont.*: A genus of ruminants belonging to the family Bovidae (Oxen). They have proportionately a larger head than oxen, with a conical hump between the shoulders, due to excessive development of the apical processes of the dorsal vertebrae, and a shaggy mane. Two species are known.  
 1. *Bison Europæus*, sometimes called *Bonassus Bison*, the European Bison. It is the *βίσωνος* (*Bonassos*) or *βόβαρος* (*Bonassos*) of Aristotle, the *βίσων* (*Bisôn*) of Oppian, the *Bison jubatus*, and the *Bonassus* of Pliny, and the *Bos bison* of Linnæus. It is often wrongly called the Aurochs, which is etymologically the same word as Caesar's *Urus* [AUROCHS]. This animal has been known from classic times, and Pliny contrasts it with the Aurochs, as does Martial, who tells us that these beasts were trained to draw chariots in the Roman amphitheatre. It was formerly abundant over Mid and Eastern Europe, and is the largest living European quadruped, standing some six feet high at the shoulder, and measuring about ten feet from the muzzle to the root of the tail, which is nearly three feet more, and the strength is proportional to the size. The general colour is dusky brown; there is a thick mane, and the hair on the forehead is long and wavy. The cows are smaller than the bulls, and the mane is thinner. The European Bison is now restricted to some part of the Caucasus, and to Lithuania, where it is strictly protected by the Czar of Russia. Some specimens have been exhibited in the gardens of the Zoological Society.  
 2. *Bison Americanus* or *Bonassus Americanus*, the American Bison, popularly but erroneously called the Buffalo. It has fifteen ribs on each side, whilst the European bison has but fourteen, and the domestic ox thirteen. They once roamed in herds in the western part of British America and in the United States. They are large and powerful animals, with great humped shoulders and a shaggy mane. They resist a moderate number of wolves, but fall a prey to the grizzly bear. They have been so relentlessly pursued by reckless hunters that they are almost exterminated, though they formerly existed in vast multitudes. At present there are only one or two small herds left, but an effort is being made to preserve and increase them in Yellowstone National Park.

From Lat. *bissextilis* = containing an intercalary day; *bisextus* = an intercalary day; *bis* = twice, and *sextus* = sixth (B. 1.).]  
 A. *As adjective*: Containing two sixth days in the kalends of the same month; containing an intercalary day in whatever way numbered; pertaining to leap year. [B.]  
 "Towards the latter end of February is the *bissextile* or intercalary day; called *bissextile*, because the sixth of the kalends of March is twice repeated."—*Holder on Time*.  
 B. *As substantive*:

1. *Roman Year*: An intercalary day introduced into the Roman month of February once in four years. The name *bissextile* = twice a sixth, was given because during leap year two days of February in succession were each called *Sexta* (*die*) *Kalendas Martii* or *Martias* = the sixth of the kalends of March. These two days corresponded to the 24th and 25th of February in our reckoning. [CALENDAR, LEAP YEAR.]  
 "The year of the sun consisteth of three hundred and sixty-five days and six hours, wanting eleven minutes; which six hours omitted, will, to time, deprave the compute; and this was the occasion of *bissextile*, or leap year."—*Brownie*.  
 2. *Our own Year*: The term *bissextile* is still retained for leap year, though there is no reckoning of two sixth days anywhere in it. When it occurs, twenty-nine days are assigned to February instead of the twenty-eight, a much more natural method of reckoning than that adopted by the Romans.  
 "Bissextile, Leap Year, which happens every fourth year, . . ."—*Glossog. Nov.*

bisulphide of carbon, s.

Chem.: Carbon disulphide, CS2. It is prepared by passing the vapour of sulphur over red-hot charcoal. Carbon disulphide is a transparent, colourless, inflammable, stinking liquid; sp. gr. 1.272; it boils at 46° C. It has great refractive and dispersive power; it burns with a blue flame, forming CO2 and SO2. It is insoluble in water, but it dissolves sulphur, gums, caoutchouc, phosphorus and iodine, and alkalis. Its vapour is very poisonous, and is very explosive when mixed with the air or with oxygen gas. Carbon disulphide unites with metallic sulphides, forming salts called Sulphocarbonates, having the composition of carbonates with the oxygen replaced by sulphur, as calcium-sulphocarbonate CaCS2. A mixture of the vapour of CS2 and H2S passed over copper heated to redness yields a copper sulphide Cu2S and marsh gas CH4. Carbon disulphide is used to kill insects, but no light must be near as its vapour is explosive.

\* 2. An old trade name for a mixture of quassia, cocculus indicus, &c., used many years ago by fraudulent brewers to give an appearance of strength to their beer. [BITTERINO.]

bit'-térn (2), \* bit-tor, \* bit-tour, \* bit-tóre, s. [In Fr. butor; Dut. buitor; Lat. butio; Low. Lat. butor, butorius; Mod. Lat. botaurus, contr. from botaurus, i.e. bos taurus = the bull; Class. Lat. taurus = a bull, bullock, or steer, ... a small bird that imitates the lowing of oxen, perhaps the bittern.]

1. Ornith. & Ord. Lang.: The English name for the birds of the genus Botaurus [BOT-AURUS], and especially for the common one, Botaurus stellaris. The Bitterns are distinguished from the Herons proper, besides other characteristics, by having the feathers of the neck loose and divided, which makes it appear thicker than in reality it is. They are usually

BITTERNS.

spotted or striped. Three species occur in Europe—the Botaurus stellaris, or Common Bittern; the B. minutus, or Little Bittern; and the B. lentiginosus, or American Bittern. The first-named species is locally named the "Mire-drum," the "Bull of the Bog," &c., in allusion to its lowing or drumming noise about February or March during the breeding season. It is about two and a half feet long. The general colour of its plumage is dull pale-yellow, variegated with spots and bars of black. The feathers of the head are black, shot with green; the bill and the legs are pale-green; the middle claw is serrated on the inner edge. It is nocturnal. It frequents wooded swamps and reedy marshes, but is rare in Britain; it is only a summer visitant. The American Bittern is a common inhabitant

of many parts of the United States. The crown of the head is reddish brown, and the plumage differs considerably from the Common Bittern. The Least Bittern (B. exilis) is another American species, of very small size and somewhat social habits.

"That a bit'or maketh that murgent coyse, or as we term it, bumping, by putting its bill into a reed as most believe, or as Bellonius and Androvaudus conceive, by putting the same in water or mud, and after a while retaining the eye by suddenly extending it again, is not so easily made out."—Browne: Vulgar Errors, iii, 27.

"Alke when first the vales the bittern fills." Wordsworth: The Evening Walk.

2. The Bittern of Scripture: THEP (Qipodh) has not been certainly identified. The Septuagint renders it εχίνος (echinos) = a hedgehog, an opinion with which Gesenius agrees. But the Scriptural animal seems to have been a bird frequenting pools of water and possessed of a voice, and the rendering of the authorised version bittern may be, and probably is, correct.

"But the cormorant and the bittern shall possess it; the owl also and the raven shall dwell in it: ..."—Isa. xxiv, 14.

"... both the cormorant and the bittern shall lodge in the upper lintels of it: their voices shall sing in the windows; ..."—Sephian. ii, 14.

**bituminous cement**. A cement made from natural asphalt. [ASPHALT (*Art and Comm.*)] It is sometimes called also *bituminous mastic*. **bituminous coals**.

*Min.*: Coals which burn with a yellow, smoky flame, and on distillation give out hydrocarbon or tar. They contain from five to fifteen, or even sixteen or seventeen per cent. of oxygen. Among bituminous coals are reckoned *Caking-coal*, *Non-caking Coal*, *Cannel* or *Parral-coal*, *Torbanite*, *Brown-coal* or *Lignite*, *Earthy-brown Coal*, and *Mineral Charcoal*. (See these words.)

**bituminous limestone**.

*Geol.*: Limestone impregnated with bitumen. Its colour is brown or black; in structure it is sometimes lamellar, but more frequently compact, in which case it is susceptible of a fine polish. When rubbed or heated it gives out an unpleasant bituminous odour. Occurs near Bristol, in Fife-shire, and in Ireland in Galway. Abroad it is found in Dalmatia so bituminous that it may be cut like soap. The walls of houses are constructed of it, and after being erected are set on fire, when the bitumen burns out and the stone becomes white; the roof is then put on, and the house afterwards completed. (*Phillips*.) Bituminous limestone is of different geological ages.

*Chem.*: C<sub>2</sub>O<sub>2</sub>N<sub>2</sub>H<sub>2</sub>. Biuret is formed by heating urea, CO(NH<sub>2</sub>)<sub>2</sub>, to 150° to 160°, thus—

The residue is heated with water; on cooling, biuret separates out in long white needle crystals which, when heated to 170°, decompose into ammonia and cyanuric acid (C<sub>3</sub>H<sub>3</sub>N<sub>3</sub>O<sub>3</sub>). Heated under current of dry hydrochloric acid gas (HCl), it yields triantidine (CH<sub>3</sub>N<sub>3</sub>) with other products. Biuret is detected by adding to its solution in water a few drops of CuSO<sub>4</sub> (cupric sulphate), and then excess of NaOH (caustic soda). The liquid turns red violet.

B. *As substantive*:

I. *Zoology*:

1. *Gen.*: A mollusc which has its shell in

two opposite portions. This definition embraces both the Coelchifera (Ordinary Bivalves), and the Brachiopoda, which are bivalves of a new abnormal character, though in early geological ages theirs was the prevalent type. [I.]

"The Brachiopoda are *bivalves*, having one shell placed on the back of the animal and the other in front."—*Woodward: Mollusca*, p. 7.

"The Coelchifera, or ordinary *bivalves* (like the oyster) breathe by two pairs of gills, in the form of flat membranaceous plates attached to the mantle; one valve is applied to the right, the other to the left side of the body."—*Ibid.*, p. 7.

2. *Spec.*: A two-valved shell borne by a mollusc of the class Coelchifera, sometimes called *Lamellibranchiata*, as distinguished from a Brachiopod. [See No. 1. COELCHIFERA, LAMELLIBRANCHIATA, BRACHIOPOD.]

"Fossil *bivalves* are of constant occurrence in all sedimentary rocks; they are somewhat rare in the oldest formations, but increase steadily in number and variety through the secondary and tertiary strata, and attain a maximum of development in existing seas."—*Woodward: Manual of the Mollusca*, p. 251.

II. *Geol.*: Shells are the most useful of all fossils for ascertaining the geological age of strata; but bivalves are not so useful as univalves, being, with a few exceptions, marine, whilst some univalves are terrestrial, some fluviatile, lacustrine, or both, and yet others marine. Still bivalves will often enable a geologist approximately to sound the depths of a sea which has passed away untold ages before man was on the earth. [SHELLS.]

*B. Intransitive*: Only in the expression to blame = to be blamed.

"[Johnson hesitated whether to call *blame* in such a phrase as "you are to blame," an infinitive of a verb or a noun with such a construction as in the French *à tort* = by wrong, wrongfully. He inclines to consider it the latter one; with more reason Professor Bain and others regard it as the former.

"He could not but feel that, though others might have been to blame, he was not himself *blämless*."—*Macaulay: Hist. Eng.*, ch. xvii.

¶ Crabb thus distinguishes between the verbs to blame, to reprove, to reprove, to upbraid, to censure, and to condemn:—"The expression of one's disapprobation of a person, or of that which he has done, is the common idea in the signification of these terms; but to blame expresses less than to reprove. We simply charge with a fault in *blaming*; but in *reproving* severity is mixed with the charge. *Reprove* expresses more than either; it is to blame acrimoniously. . . . To blame and reprove are the acts of a superior; to reprove, upbraid, that of an equal: to censure and condemn leave the relative condition of the agent and the sufferer undefined. Masters blame or reprove their servants; parents, their children; friends and acquaintances reprove and upbraid each other; persons of all conditions may censure or be censured, condemn or be condemned, according to circumstances. . . . *Blame* and reprove are dealt out on every ordinary occasion; reprove and upbraid respect personal matters, and always that which affects the moral character; censure and condemnation are provoked by faults and misconduct of different descriptions." *Blame, reprove, upbraid,*

and condemn may be applied to ourselves; reproof and censure are applied to others: we blame ourselves for acts of imprudence; our consciences reprove us for our weaknesses, and upbraid or condemn us for our sins. (Crabb: Eng. Synon.)

\* **bläme** (1), s. [From O. Eng. *blame* (1), (q.v.).] Injury, hurt.

1. The act of censuring any one; the expression of censure for some fault or crime. The act of imputing demerit to any one on account of a fault; the state of being censured or found fault with.

"They were insensible to praise and blame, to promises and threats."—*Macaulay: Hist. Eng.*, ch. xv.

2. Anything for which censure is expressed; anything blameworthy; demerit, a fault, a misdemeanour, a crime.

(2) It is sometimes followed by to placed before the person or Being who has no ground for pronouncing censure.

¶ *Precise signification*:

Crabb thus distinguishes between *blämless*, *irreproachable*, *unblemished*, *unspotted*, or *spotless*:—"Blämless is less than *irreproachable*; what is *blämless* is simply free from blame, but that which is *irreproachable* cannot be blamed, or have any reproach attached to it. It is good to say of a man that he leads a *blämless* life, but it is a high encomium to say, that he leads an *irreproachable* life: the former is but the negative praise of one who is known only for his harmlessness; the latter is the positive commendation of a man who is well known for his integrity in the different

Unblemished and unspotted are applicable to many objects, besides that of personal conduct; and when applied to this, their original meaning sufficiently points out their use in distinction from the two former. longing to the order Polypodiaceæ. The sterile fronds are pectinato-pinnatifid and horizon-

tal; the fertile ones pinnated and erect with numerous segments. Both are smooth. The pinnæ are linear, bluntish, entire, nearly equal at base. Along the back of the fronds in these ferns the spore-cases are arranged in a long, narrow, continuous line on each side of the mid-rib. This line has a covering in its early stages, but it soon splits down the side next the mid-rib, and the spore-cases appear to cover the whole under-surface of the fronds. The sori at first are distant from the margin, while in the very closely allied genus Lomaria they are truly marginal. The Hard-fern most resembles the Bracken in the fruiting. It will readily grow on rock-work in the open air. Cool, shady places suit it best.

II. Her. [BLEMISHED.]

**blēm-īsh**, s. [From *blemis*, v. (q.v.)]  
I. Ordinary Language:  
1. A mark of defect, a deformity; anything which seriously diminishes or mars physical beauty in the body of man or beast.  
"And if a man cause a *blemis*h in his neighbour; as he hath done, so shall it be done to him; Breach for breach, eye for eye, tooth for tooth: as he hath caused a *blemis*h in a man, so shall it be done to him again."—*Lev.* xiv. 19, 20.  
"For whatsoever man he be that hath a *blemis*h, he shall not approach; a blind man, or a lame, or he that hath a flat nose, or any thing superfluous. Or a man that is broken-footed, or broken-handed, or crook-backed, or a dwarf, or that hath a *blemis*h in his eye, or be scurvy. . . . No man that hath a *blemis*h of the seed of Aaron the priest shall come nigh to offer the offerings of the Lord made by fire: he hath a *blemis*h . . ."—*Lev.* xxi. 18—21.

¶ For animal blemishes see II. Theol.  
2. A blot or taint upon the mind, moral character, or reputation.  
"Evanne's husband 'tis a fault  
To love, a *blemis*h to my thought."  
Waller.  
"None more industriously publish the *blemishes* of an extraordinary reputation, than such as lie open to the same censures."—Addison.  
3. A defect in anything.  
"Spots they are and *blemishes*, sporting themselves with their own deceivings while they feast with you."—2 Pet. ii. 12.  
"It was determined to remove some obvious *blemishes*."—*Macculay: Hist. Eng.*, ch. xiv.

II. Theology:  
¶ Under the Jewish ceremonial law it was enjoined that no animal should be vowed and offered in sacrifice unless it were without blemish, *Lev.* xiii. 20, 21. See also *Exod.* xii. 5; *Lev.* i. 8; *xiv.* 10; *Numb.* xxix. 8, &c., &c. What were held to constitute blemishes in an animal may be learned from *Lev.* xxii. 21—25. The general opinion of theologians is that this absence of blemish was designed to typify the spotless character of Christ.  
". . . he shall take two he lambs without *blemish*, and one ewe lamb of the first year without *blemish*."—*Lev.* xiv. 10.  
"But with the precious blood of Christ, as of a lamb without *blemish* and without spot."—1 Pet. i. 19.  
¶ (1) Crabbs thus distinguishes between *blemish*, *stain*, *spot*, *speck*, and *flaw*:—"In the proper sense *blemish* is the generic, the rest specific; a *stain*, a *spot*, *speck*, and *flaw* are *blemishes*, but there are likewise many *blemishes* which are neither *stains*, *spots*, *specks* nor *flaws*. Whatever takes off from the seamliness of appearance is a *blemish*. In works of art the slightest dimness of colour or want of proportion is a *blemish*. A *stain* and *spot* sufficiently characterise themselves, as that which is superfluous and out of place. A *speck* is a small *spot*; and a *flaw*, which is confined to hard substances, mostly consists of a faulty indenture on the outer surface. A *blemish* tarnishes; a *stain* spoils; a *spot*, *speck*, or *flaw* disfigures. A *blemish* is rectified, a *stain* wiped out, a *spot* or *speck* removed. *Blemish*, *stain*, and *spot* are employed figuratively. Even an imputation of what is improper in our moral conduct is a *blemish* in our reputation; the failings of a good man are so many *spots* in the bright hemisphere of his virtue; there are some vices which affix a *stain* on the character of nations, as well as of the individuals who are guilty of them. A *blemish* or a *spot* may be removed by a course of good conduct, but a *stain* is mostly indelible: it is as great a privilege to have an *unblemished* reputation, or a *spotless* character, as it is a misfortune to have the *stain* of bad actions affixed to our name."  
(2) *Blemish*, *defect*, and *fault* are thus distinguished:—"Blemish respects the exterior of an object; *defect* consists in the want of some specific propriety in an object; *fault* conveys the idea not only of something wrong, but also of its relation to the author. There is a *blemish* in fine china; a *defect* in the springs of a clock; and a *fault* in the contrivance. An accident may cause a *blemish* in a fine painting; the course of nature may occasion a *defect* in a person's speech; but the carelessness of the workman is evinced by the *faults* in the workmanship. A *blemish* may be easier remedied than a *defect* is corrected or a *fault* repaired." (Crabb: *Eng. Synon.*)

**I. Ordinary Language:**

**1. Gen.**: Any physical cause unfavourably

affecting the growth of cereal plants, flowers, fruits, or whatever else is cultivated, nipping the buds, making the leaves and blossoms curl up and wither, imparting to them a sickly yellow hue, covering them with spots of an abnormal colour, or injuring them in any similar way.

**2. Spec.**: A certain noxious influence in the air, of which the haze often seen in hot weather is the accompaniment, which is popularly supposed to injure plants, either directly by destroying their vitality, or indirectly by calling into existence fungi and insects, to which they become a prey. (For the real explanation of the phenomena, see II.)

"... Ah, gracious heaven! attend His fervent prayer; restrain the tempest's rage, The dreadful blīght disarm." *Dodley: Agricultura*, s. 3.

**3. Figuratively:**

(1) Anything which makes a person droop, or that which is fruitful or valuable waste away, decay, and die.

"When you come to the proof once, the first blīght of frost shall most infallibly strip you of all your glory."—*L'Estrange.*

(2) The act of causing to wither; the state of being withered.

"But should there be to whom the fatal blīght Of falling Wisdom yields a base delight." *Byron: Death of Mr. Ken. M. B. Sheridan.*

**II. Science:** To explain the effects on plants described under No. 1., recourse must be had to the teachings of meteorology, botany, and zoology.

**1. Meteor.**: If in early spring, when the shoots of plants are tender and succulent, and exhale much moisture, the east wind, which is dry as well as cold, blow upon them, it makes the plants part with their moisture too rapidly, and thus does them injury. If night frosts congeal the moisture in the delicate tissues, these are likely to be rent asunder and die. The turbid and hazy state of the atmosphere, to which so much evil is popularly attributed, is caused by difference of temperature between the earth and the air, and has not in it anything noxious to vegetation.

"I complained to the oldest and best gardeners, who often fell into the same misfortune, and esteemed it some blīght of the spring."—*Temple.*

**2. Botany:**

(1) *Gen.*: Many "blights" are produced by the attacks of parasitic fungi. The late Rev. M. J. Berkeley, the fungologist, believed that the fungi which in some cases have arrested the development of corn and other cereals, and made the plants decay, have attacked their roots, having grown originally on the decomposing remains of the previous year's crop still rooted in the ground. [BARBERRY BLIGHT, MILDEW, RUST, &c.]

(2) *Specialty:*

(a) Plants of the fungoid genus *Ustilago*. (*Minsheu.*)

(b) The English name of the fungoid genus *Rubigo*. It is called also *Mildew* (q.v.).

**3. Zool.**: Other "blights" are produced by the attacks of insects. The curling up of leaves generally arises from the caterpillars of lepidopterous insects. Some caterpillars hatched from eggs deposited inside leaves mine within the latter unseen for a time. For instance, those of the Small Ermine Moth (*Yponomeuta padella*) do so when young; then, when grown sufficiently, they emerge in untold numbers and commence to devour the leaves themselves. Curled leaves often shelter Aphides, and sometimes Coccidæ [AFHIDÆ, COCCUS]. Galls are formed by Gall-flies [CYNIPIDÆ]. Species of many other genera and families can "blight" plants. [AMERICAN BLIGHT.]

**¶ For the causes which produce blindness** see **BLINDNESS**. The number of blind averages about 1 to 1,000 of the population, so that there are approximately 70,000 blind persons in the United States. The deprivation of sight to an individual makes him attend to his other senses, which by continued exercise become more acute. The intellectual development of the blind is not prevented by their infirmity nearly so much as it is in the case of the deaf, and the list of blind men who have distinguished themselves is a long one. When modern Christian philanthropy began to turn special attention to the blind, it was thought enough to furnish them here and there with an "asylum" [BLIND ASYLUM]; the extent to which they could be educated by proper means was not as yet understood. The Abbé Valentine Haüy will for ever be gratefully remembered by the blind, he having established the first school for their education in Paris in 1784. Two years later he had books for their benefit printed in raised or embossed characters. In his footsteps have followed Mr. Jas. Gall of Edinburgh, Mr. John Alstone of Glasgow, Dr. How of America, Mr. Lucas of Bristol, Mr. Frere of London, Mr. Moon of Brighton, Mr. Wait of New York, and others. About 1848 the whole Bible was printed at Glasgow in raised Roman characters, and in 1855-6 the Rev. W. Taylor, F.R.S., edited a sixpenny magazine for the benefit of the blind.

Of blind asylums, schools for the blind, &c., one was founded in Menningen by Weef VI. in 1173, and another in Paris by St. Louis in 1269. The first in Britain was commenced at Dublin in 1781, the next in Liverpool in 1791. Others have been built in the large cities of Great Britain, and in all the principal cities of the United States. In these the intellectual and industrial education of the blind has been very carefully attended to.

1. *Lit.*: The state of being blind; temporary or permanent want of sight.

¶ Sometimes blindness exists from birth; at other times it is the result of disease at some period or other of life. It may be produced by the severer kinds of ophthalmia. Many soldiers of the British army which, on the 8th and 21st of March, 1801, fought the battles of Aboukir and Alexandria, were seized with ophthalmia while in Egypt, and on returning home communicated the disease to regiments which had never been in Africa; many in consequence lost their eyesight. Malignant small-pox can produce the same result; a large proportion of the blind men now in India were deprived of vision in this way. Patients become blind after fever, measles, hooping-cough, or convulsions, or through cataract, inflammation of some part of the delicate machinery of the eye, violence, accident, or the decay of the system produced by old age. [For the treatment of the blind, see BLIND (1), s.]

**A. Intransitive**:

A. As substantive:  
I. Ordinary Language:  
1. Literally. (Borrowed from the medical and pharmaceutical uses of the word):  
(1) A vesication on the human body or on the body of an animal. [II. 1.]  
"In this state she gallops, night by night  
O'er ladies' lips, who straight on kisses dream,  
Which oft the angry Mab with blisters plagues,  
Because their breaths with sweetmeats tainted are."  
*Shakespeare: Rom. & Jul.*, I. 4.  
"I found a great blister drawn by the gentle, but had it cut, which run a good deal of water, but died again by next night."  
*Temple*.  
(2) An appliance for producing it. [II. 2.]  
2. Fig.: Anything resembling a vesication on a plant, on a painted surface, on iron, or anything else. [II. 3.]  
II. Technically:  
1. Med.: A vesication produced upon the skin by an external irritating application, or by the friction of something hard. But the special use of the term is for a vesication produced intentionally for medical purposes by the application of a blister-plaster, of which the virtue consists in the powdered "Spanish" or "bilater" flies scattered over the surface [2]. When this is first placed upon the skin there arises a sense of tingling and heat, followed by redness and pain, after which the cuticle rises into a vesicle or bladder filled with a watery fluid like the serum of the blood. On the puncturing of the bladder this at once escapes. In a few days the destroyed cuticle has its place supplied by new skin. Such blisters by attracting blood to them tend to withdraw it from morbidly gorged internal organs in a state of inflammation, besides setting up a second morbid action of which the tendency is to counterwork the first, with great relief to the system. [BLEB, PEMPINOUS, VESICATION.]  
2. Pharm.: A vesicatory designed to act upon the skin. It is generally made of the Spanish or blister-fly [BLISTER-FLY] powdered, mixed with lard and wax; the whole spread upon leather. It is commonly applied to the skin of the patient for ten or twelve hours.  
3. Bot.: A morbid swelling like a vesication in a leaf, produced by the puncture or excavation of insects, or by any other cause.  
"Upon the leaves there riseth a tumour like a blister."  
*Dacon*.  
B. As adjective: Producing vesications on the skin, as BLISTER-BEETLE (q.v.).

**blister-beetle**, *s.* The same as BLISTER-FLY (q.v.).

**blister-fly**, *s.* The name for any "fly" using that term in its widest sense to designate any flying insect. The more common blister-flies are beetles, and they are in consequence sometimes called blister-beetles. That most frequently employed by medical men for raising blisters on the skin is the *Lytta vesicatoria*, formerly called *Cantharis vesicatorius*. It feeds on the ash. It is indigenous in the South of Europe, and being among other pieces imported from Spain, is often called the Spanish-fly. [BLISTER-BEETLE, CANTHARIS, LYTTA, SPANISH-FLY.]

**II. Technically:**  
1. *Mech.*: A pulley, or a system of pulleys rotating on a pintle mounted in its frame or

BLOCKS.

shell with its band and strap. The *pin* or *pintle* of a block of pulley is the axis or axle. It passes through the *bushing* of the shell and the *cock* of the sheave, and is generally of iron. The *sheave* or wheel is generally of lignum-vitæ or of iron, and has around its circumference a groove for the rope, called the *gorge*. It has a bushing, called a *cock*, around the pintle-hole. The space between the sheave and its block, through which the rope runs, is called the *swallow* or *channel*. It answers to the *throat* of some other machines; and the *pass* in a rolling-mill. The *shell*, pulley-frame, or body of the block is made of a tough wood, or sometimes of iron; it has one or two grooves, called *scores*, cut on each end to retain the *strap* which goes around it. The *shell* is hollow inside to receive the sheave or *sheaves*, and has a hole through its centre to receive the sheave-pin, called the *pintle*; this is lined with bronze or gun-metal, called a *bushing* or *bushing*. When the shell is made of one piece, it is called a *mortise-block*; when more than one are employed, it is termed a *made block*. The side plates of the shell are *cheeks*. The *strap*, *strap*, *iron-binding*, *grommet*, or *cringle*, is a loop of iron or rope, encircling the block, and affords the means of fastening it in its place. The *hook* of iron-strapped blocks is frequently made to work in a swivel, so that the several parts of the rope forming the tackle may not become "foul" or twisted around each other. (*Knight.*)

There are many kinds of blocks, as a *pulley-block*, a *fiddle-block*, a *fish-block*, a *fly-block*, a *heart-block*, a *hook-block*, &c. See these words.

**block-book, s.**  
*Printing:* A book printed not from movable types, but from engraved blocks, each one forming a page. Block-printing had long been known [BLOCK-PRINTING] before the art was used in the preparation of books. In 1438 Lourenz John Koster of Haarlem published his *Speculum Humane Salvationis* with blocks; the *Biblia Pauperum*, published early in the fifteenth century, was also a block-book. About 1450 movable types began to be used, and block-books were superseded. [PRINTING.]

**block-machinery, block machinery, s.**  
*Mech.*: Machinery for cutting, shaping, and adjusting the "blocks" to be associated with "tackles" in the navy and in merchant vessels. In A. D. 1781, Mr. Walter Taylor of Southampton took out a patent for such machinery, and from his works on the Itchen supplied the navy with all the blocks it required for more than twenty years. About the beginning of the present century, Mr., afterwards Sir Mark Isambart Brunel, constructed an improved machine, or rather series of machines, for block-cutting, mortising, shaping, scoring, drilling, &c., which being adopted by the government, led to their becoming their own block manufacturers at Portsmouth, and turning out the most beautifully-made and adjusted articles in numbers amply sufficient to supply the whole navy, without assistance from any private firm. The machines used for dressing the shells of the blocks are (1) a *reciprocating cross saw*, (2) a *circular cross-cut saw*, (3) a *reciprocating ripping saw*, (4) a *boring-machine*, (5) a *mortising-machine*, (6) a *corner-saw*, (7) a *shaping-machine*, and (8) a *scoring-machine*. A *reciprocating*, a *circular*, and a *crown saw* are used for rounding the sheaves and boring the centre hole. There are, besides, a *coating-machine*, a *drilling-machine*, a *riveting-machine*, and a *facing-lathe*.

**block-printing, s.**  
*Printing:* The art or process of printing from blocks instead of from movable types. It is supposed to have been invented by the Chinese about A. D. 593. It has been long employed in calico-printing in that country, as well as in India, Arabia, and Egypt. In Europe the same process was adopted for printing playing-cards, and during the first half of the fifteenth century books were produced by means of block-printing; they were hence called block-books. [BLOCK-BOOK.] Now block-printing is used for printing cotton cloth or paper for hangings. Two stages of progress in the method are to be traced. First the pattern was dabbed upon the colour and impressed by hand upon the material, which lay upon a table before the workman. When the pattern was in several colours, different blocks of the same size were employed, the raised pattern in each being adapted for its special portion of the design. The exact correspondence of each part, as to position, was secured by pins on the blocks, which pierced

small holes in the material and indicated the exact position. Next, an improved system by Perrot was introduced, in which the calico passed between a square prism and three engraved blocks, brought in apposition to three faces of the prism, and delivered their separate impressions thereupon in succession. Each block was inked after each impression, and the cloth was drawn through by a winding cylinder. The blocks were pressed against the cloth by springs. Perrot's system did twenty times as much work in an hour as that which it all but displaced. Now block-printing has been superseded by cylinder or roller-printing, which works twenty times as fast as even Perrot's method. (*Knight.*)

**block-system, block system, s.**  
*Railway Travelling:* A method of signalling specially designed to prevent collisions between trains travelling on the same line of rails. The route to be traversed is divided into small sections by telegraph boxes erected at intervals. Let A D in the fig. be a portion of such a line with signal-  
A t'' B t' C D  
boxes at A, B, C, and D. Let t'' and t' be two trains both moving in the direction of the arrows. If t'' overtake t' there will be a collision, but the block-system prevents this by setting the danger-signal at B against the train t'' till t' has passed C. Then the danger-signal is set at C against train t'' till t' has passed D, and so in succession. If the system is properly worked two trains are never for a moment in the same section of the railway, and cannot therefore come into collision.

**block-teeth, s.**  
*Dentistry:* Two or more teeth made in a block carved by hand.

**block-tin, s.** [Eng. block, and tin. In Sw. *blocktinn*; Dut. *bloktin*; Ger. *blockzinn*.]

I. *Mil., Naut., & Ord. Language:*  
1. *Gen.*: The act of surrounding a town with a hostile army, or, if it be on the sea-

coast, of placing a hostile army around its landward side, and ships of war in front of its sea defences, so as if possible to prevent supplies of food and ammunition from entering it by land or water. The object of such an investment is to compel a place too strong or too well defended to be at once captured by assault, to surrender on account of famine.

"It seemed that the siege must be turned into a blockade."—Macaulay: *Hist. Eng.*, ch. xii.

¶ Almost every siege involves a blockade, but in a siege, properly so called, military approaches are pushed on against the place with the view of ultimately capturing it by assault, whereas in a blockade no assault is contemplated. Most of the sieges of antiquity were only blockades.

2. *Spec.*: The investment of a place by sea, to prevent any ships from entering or leaving its harbour. The practice seems to have been introduced by the Dutch about A. D. 1584.

¶ (1) To break a blockade: Forcibly to enter a blockaded port, if not even to compel the naval force investing it to withdraw.

- (2) To raise a blockade:
- (a) To desist from blockading a place.
- (b) To compel the investing force to do so.
- (3) To run a blockade: Surreptitiously to enter or leave a blockaded port at the risk of being captured.

II. *International Maritime Law*: As a blockade seriously interferes with the ordinary commercial right of trading with every place, international law carefully limits its operation, the principle adopted being this: that belligerents are not entitled to do anything likely to incommode neutrals more than it benefits themselves. Neutrals are therefore entitled to disregard a blockade except it be *effective*, that is, unless the town be invested by a fleet sufficient to prevent the ingress and the exit of vessels. When on the 21st November, 1806, the Berlin decree of Napoleon I. declared the whole British Islands in a state of blockade, that blockade, being ludicrously ineffective, was illegal; so also, though to a somewhat less extent, were the British orders in Council of the 11th and 21st November, 1807, which placed France and all its tributary states in a state of blockade. The retaliatory Napoleonic Milan decree of 27th December, 1807, extending the previously announced blockades to the British dominions in all quarters, laboured to a still greater extent under the same defect. More effective, as being more limited in area, were the blockades of the Elbe by Britain in 1803, that of the Baltic by Denmark in 1845-9 and 1864, and that of the ports of the Confederate States of America by President Lincoln on April 19, 1861. A blockade should be formally notified before it is enforced, permission being granted to neutral vessels then to depart, carrying with them any cargo which they may already have on board; when it terminates, its cessation should also be formally declared. Any one running a blockade does so at his own peril; one's own government cannot by international law protect him from forfeiting his vessel with its cargo and his liberty, if he be captured by the blockading fleet.

The book-covers are introduced *seriatim* upon the lower bed by the operator, who by a turn of the handle brings the upper bed down with a gentle and equable pressure, fixing the gold-leaf, when this is employed, upon the surface, previously prepared for the purpose. II. Technically:

1. *Physiol.*: The red circulating fluid in the bodies of man and the higher animals. It is formed from chyle and lymph when these substances are subjected to the action of oxygen taken into the lungs by the process of inspiration. It is the general material from which all the secretions are derived, besides which it carries away from the frame whatever is noxious or superfluous. In man its tempera-

ture rarely varies from 36° 6' C = 98° F., but in birds it sometimes reaches 42° 8' C = 109° F. The blood in reptiles, amphibia, and fishes, and the circulating fluid in the invertebrata, is cold, that is, in no case more than a little above the temperature of the surrounding medium. The vessels which conduct the blood out from the heart are called arteries, and those which bring it back again veins. The blood in the left-hand side of the heart and in the arteries, called arterial blood, is bright red; that in the right side of the heart and in the veins, called venous blood, is blackish-purple. Viewed by spectrum analysis, the hemoglobin of arterial blood differs from that of venous blood, the former being combined with oxygen, and the latter being deoxygenated. The film of the two also differs, besides which carbonic acid predominates in the gaseous matter held in solution in the former, and free oxygen in the latter. The density of blood is 1.003 to 1.057. Its composition in 1,000 parts is as follows:—

Water	780.15	785.58
Film	2.10	3.57
Albumen	65.09	69.41
Colouring matter	133.00	119.63
Crystallisable fat	2.43	4.30
Fluid fat	1.31	2.27
Extractive matter of uncertain kind	1.79	1.92
Albumen, with soda	1.26	2.01
Sodium and potassium chlorides, carbonates, and sulphates, and sulphate	8.87	7.30
Calcium and magnesium carbonates, phosphates of calcium magnesium and iron, ferric oxide	2.10	1.42
Loss	2.40	2.59

Blood has a saline and disagreeable taste, and when fresh, a peculiar smell. It has an alkaline re-action. It is not, as it appears, homogeneous, but under a powerful microscope is seen to be a colourless fluid with little round red bodies called *blood-discs* or *blood-corpuscles*, and a few larger ones called *white-corpuscles* floating about in it. [BLOOD-DISC, CORPUSCLE.] When removed from the body and allowed to stagnate it separates into a thicker portion called *error*, *crassamentum*, or *clot*, and a thinner one denominated *serum*. [See these words.]

"The blood is the immediate *pabulum* of the tissues; its composition is nearly or entirely identical with them; it is, indeed, as Borden long ago expressed it, liquid flesh."—*Todd & Bowman: Physiol. Anat., i. 43.*

2. Law:

(2) *Corruption of blood* is the judicial stripping it of the right to carry with it up or down the advantage of inheritance [ATTAINER]; its purification or restitution is in it the restoration to it of the privilege of inheritance. (*Ibid., ch. xv., bk. iv., ch. 29, 31.*)

Crab thus distinguishes between to blot out, expunge, erase or efface, cancel, and

obliterate: "All these terms obviously refer to characters that are impressed on bodies; the first three apply in the proper sense only to that which is written with the hand, and bespeak the manner in which the action is performed. Letters are blotted out, so that they cannot be seen again; they are expunged, so as to signify that they cannot stand for anything; they are erased, so that the space may be re-occupied with writing. The last three are extended in their application to other characters formed on other substances: efface is general, and does not designate either the manner or the object; inscriptions on stone may be effaced, which are rubbed off so as not to be visible. Cancel is principally confined to written or printed characters; they are cancelled by striking through them with the pen; in this manner, leaves or pages of a book are cancelled which are no longer to be reckoned. Obliterate is said of all characters, but without defining the mode in which they are put out; letters are obliterated which are in any way made illegible. Efface applies to images, or the representations of things; in this manner the likeness of a person may be effaced from a statue. Cancel respects the subject which is written or printed; obliterate respects the single letters which constitute words. Efface is the consequence of some direct action on the thing which is effaced; in this manner writing may be effaced from a wall by the action of the elements. Cancel is the act of a person, and always the fruit of design. Obliterate is the fruit of accident and circumstances in general; time itself may obliterate characters on a wall or on paper." Steam is introduced by means of pipes coiled round within the vessels to dissolve the sugar, which then becomes a dark, thick, viscous liquid; a small portion of lime-water is admitted to the sugar, and constant stirring with long slender rods assists the process of liquefaction. The blow-up pans are generally rectangular, six or seven feet long, three or four feet wide, and three feet deep, with perforated copper pipes near the bottom, through the holes of which steam is blown into the sugar. [KNIGHT.]

¶ Precise signification of blow: Crabb thus distinguishes between blow and stroke:—

"Blow is used abstractedly to denote the effect of violence; stroke is employed relatively to the person producing that effect. A blow may be received by carelessness of the receiver, or by a pure accident; but strokes are dealt out according to the design of the giver. Children are always in the way of getting blows in the course of their play, and of receiving strokes by way of chastisement. A blow may be given with the hand or with any flat substance; a stroke is rather a long-drawn blow, given with a long instrument like a stick. Blows may be given with the flat part of a sword, and strokes with a stick. Blow is seldom used but in the proper sense; stroke sometimes figuratively, as 'a stroke of death,' or 'a stroke of fortune.'" (Crabb: Eng. Synon.)

II. Naut.: A violent wind, a gale.

II. Mechanics:

1. A machine for creating by means of pressure an artificial current of air. It is the same as a plenum engine as distinguished from a vacuum engine, such as an aspirator. A blower in the form of wooden bellows was used at Nuremberg in 1550. An improved blower with a flat vane reciprocating in a sector-shaped box, with a pipe for the egress of the air, was made about 1621, by F. Fannenschmid of Thuringia. The next type was that of cylinders with pistons, which is still in use. Another one still in use is the fan-blower, believed to have been invented by Terai in 1729. Yet another is the Water-bellows or Hydraulic bellows, first made by Hornblower. Blowing-machines were erected by Smeaton at the Carron Ironworks in 1760. The hot-air blast was patented in 1828 by the inventor, James Neilson of Glasgow. The main use of blowers is to increase draughts in furnaces, to ventilate buildings, to dry grain or powder, to evaporate liquids, &c.

2. An iron plate temporarily placed in front of an open fire, to urge the combustion.

3. A simple machine designed to furnish air to an organ or harmonium.

" . . . composition pedals, hand and foot blowers . . ."—Adv., Times, Nov. 4, 1875.

**blōw-pipe, s. & a. [Eng. blow; pipe.]**

**A. As subst.:** An instrument for directing the flame of a lamp, of a candle, or jet of gas, mixed with air, against a spot on which is placed a minute body which the operator designs to subject to the action of more than ordinarily intense heat. The several types of blowpipe are:—

1. **The Mouth Blowpipe:** This consists of a conical tube of tin plate about eight inches long, open at the narrow end and closed at its lower part, from the side of which projects a small brass tube about an inch long, at the extremity of which is a brass jet. The jet is inserted about one-eighth of an inch into the flame of a lamp, and a current of air is blown into the flame, which then assumes the

form of a pointed cone (see figure). In the centre there is a well-defined blue cone, consisting of a mixture of air with combustible gases; in the front of which is a luminous portion, containing the unburnt gases at a high temperature. This is the reducing flame; and outside it is a pale yellow one terminating at the point O. The part now described contains oxygen at a high temperature, mixed with the products of complete combustion, being the

**ANCIENT EGYPTIAN BLOWPIPE.**

oxidizing part of the flame. The mouth blowpipe is of great antiquity; a man using one for

metallurgic purposes is represented in an ancient painting at the Egyptian Thebes. It was used by jewelers during the Middle Ages for fusing metals; its adoption as an instrument for mineralogical and chemical analysis is mainly due to Antony Swab, a Swedish councillor of mines, in 1738, and Cronstedt, who published a "System of Mineralogy" in 1758. There are various forms of blowpipe, as Gahn's, Wollastou's, and Dr. Black's. To use the apparatus it is necessary to acquire the art of keeping the lungs supplied with air through the nostrils, whilst securing a steady stream through the blowpipe from the mouth; the communication between the mouth and the lungs being closed by a peculiar action of the tongue, which is drawn back against the orifice. The small body to be subjected to examination may be held in a small forceps, or if easily fusible, in a small silver or platinum spoon, but the ordinary reat, the one used to support metallic oxides and many other minerals, is of well-burnt wood charcoal, in which a small cavity has been made with a knife. The body to be examined should not be larger than a peppercorn.

¶ In chemical analysis the blowpipe is used to examine solid substances.

(a) Heated on charcoal, oxides of lead, copper, and silver, &c., yield metallic beads in the reducing-flame, especially when mixed with carbonate of sodium or cyanide of potassium.

(b) The blowpipe is used to make borax-beads (q.v.).

(c) Under its operation some substances are found to be fusible and others volatile; in the latter category are ranked mercury, arsenic, and ammonium compounds.

(d) Salts of zinc give a green colour when heated on charcoal with  $\text{Co}(\text{NO}_2)_2$ , cobalt nitrate; aluminium salts, phosphates or allicates a blue colour, salts of magnesia a pink colour.

(e) Chromium salts fused with potassium nitrate, on platinum foil, give a yellow mass of potassium chromate; manganese salts, a green mass of potassium manganate.

(f) Salts of certain metals give characteristic colours when moistened with hydrochloric acid and heated in the blowpipe flame. Thus sodium salts give yellow, potassium salts violet, strontium and lithium salts crimson, calcium salts orange-red, barium salts yellow-green, thallium salts green, and copper salts blue-green colours.

(g) Certain metals give incrustations on charcoal when heated in the oxidizing flame. Lead gives yellow, bismuth brownish-yellow, antimony bluish-white, and cadmium reddish-brown incrustations.

2. **The Bellows Blowpipe, i.e., a blowpipe in which the flame is supplied by air not by the human breath but from a pair of bellows. It is used chiefly by glass-blowers, glass-pinchers, enamellers, &c.**

3. **The Oxhydrogen Blowpipe** is one in which not common air but a mixture of oxygen and hydrogen is used. These being made to issue from two separate reservoirs and afterwards unite in a single jet, or to pass from a common bladder through the safety jet of Mr. Hemaning, are then directed through the flame, with the result of producing a heat so intense as to fuse various bodies which are found quite intractable under the ordinary blowpipe. The oxhydrogen blowpipe was invented in 1802 by Prof. Robert Hare, of Philadelphia. One was also made by Sir Humphrey Davy at the suggestion of Mr. Children.

4. **The Airhydrogen blowpipe**, in which atmospheric air and hydrogen are the two gases used.

5. **Bunsen's burner** (q.v.).

Boarding-out system. Poor Law administration: A system by which workhouse children are sent to be boarded in the houses of poor people, to whom the sum paid for their maintenance is an object. They are then brought up, presumably in habits of industry, as members of the family in which they live. The boarding-out system is prevalent in Scotland. In England it exists only in a few places, and has become the subject of controversy. Its friends claim for it the advantage that when children are brought up away from the workhouse their pauper associations and feelings are permanently broken, and they tend to become ordinary members of society, living by their own industry and not on the stipends. Its opponents point out the danger of the poor people ill-treating the child not allied to them by blood. Both parties will probably agree in this, that when children are boarded out, lady or other visitors should from time to time visit the houses where they live to ascertain the kind of treatment they are receiving from their foster-parents, as well as from the genuine children of the household.

board-ing-pike, s. Naut.: A pike used to defend a ship against enemies who may attempt to board it. Or it

may be employed as an offensive weapon by the boarders themselves. Such pikes are represented in a sea-fight at Medinet Aboo, in Egypt.

II. **Technically:**

1. **Spinning:** A spool with a head at one or both ends to hold yarn. It has one head when it serves as a cop in spinning, as a thread-holder in shuttles of looms, and as cop in warping-machines. 2. **Sewing-machine:** A small spool adapted to receive thread and to be applied within a shuttle. (*Knight*.)

**bobbin and fly frame.** The ordinary roving machine of the cotton manufacture. Its function is to draw and twist the sliver, and wind the roving on a bobbin. The bobbin containing the slivers are mounted in several rows on a creel which has skewers for their reception. Each sliver passes between a pair of guides, which give it a horizontal traversing motion, so that it shall not bear upon a constant part of the surfaces of the drawing-rollers between which it next passes. These drawing-rollers are arranged in pairs (see DRAWING-FRAME), and have a relatively increasing rate of speed, the second revolving faster than the first, and the third revolving faster than the second. The bobbin has two motions—one around the spindle on which it is sleeved, and

one up and down on the spindle. The former is for the winding on of the roving, and the latter to distribute the roving in coils alongside each other along the length of the bobbin. Bobbin and fly frames are of two kinds, coarse and fine, or first and second. The coarse, or first, bobbin and fly frame acts upon slivers from cans filled at the drawing-frame and placed at the back of the machine. The fine, or second, bobbin and fly frame acts upon rovings, or slubbings as they are often called, from bobbins filled at the first frame and placed on the skewers of the creel placed behind the roller-beam. (*Knights*.)

**bobbin-lace, s.**

*Weaving:* Lace made upon a pillow with bobbins. The pillow is a hard cushion covered with parchment, on which the pattern of the meshes is drawn. Pins are inserted into the lines of the pattern and determine the meshes. Thicker thread, called gimp, is interlaced with the meshes, according to the pattern on the parchment. The thread is wound upon bobbins, and is twisted, crossed, and secured by pins. [*PILLOW-LACE.*]

**bobbin-stand, s.**

A frame for holding the bobbins for warps of a loom, threads of a warping-machine, and yarns of a spinning-machine. The bobbin or reel rotates on a spindle fixed in a base-plate. It is covered with a metallic disk, supported a little above the top of the spool on a shoulder of the spindle, and held down by a screw-nut.

*Weaving:* A device for winding thread or yarn upon a bobbin. The bobbin is supported on a fixed shaft, which is made to rotate continuously.

*Sewing-machine:* A device adapted to receive a shuttle-bobbin and rotate it so that it may be wound with thread. **bōb'-bin-ēt, s.** [Eng. bobbin; (*n*).et.]

*Weaving:* A machine-made cotton net, originally imitated from the lace made by bobbins upon a pillow. It consists of a series of parallel threads which may be considered as warp-threads, and two systems of oblique threads which proceed from the right to the left, and from the left to the right respectively. Each weft thread has a single turn around each crossing of a warp, and the contrary strain of the respective weft threads gives a serpentine course to the warps.

**bobbinet-machine, s.** A machine for making bobbinets. It was originally derived from the stocking-frame, invented in 1589 by William Lee, M.A., of Cambridge. Hammond (about 1768) modified a stocking-frame to make a coarse imitation of Brussels ground; this was the pin-machine. In 1784, the warp-frame was invented, for making warp-lace; and in the next decade, the bobbin-frame. In 1809, Heathcote invented the bobbinet-machine. (*Knights*.)

1. *Med.:* A disease called by medical men *furunculosis* (q.v.). It is a phlegmonous tumour, which rises externally, attended with redness and pain, and sometimes with a violent, burning heat. Ultimately it becomes pointed, breaks, and emits pus. A substance called the core is next revealed. It is lumpy, but so thick and tenacious that it looks solid, and may be drawn out in the form of a cylinder, *mora pus* following. The boil then heals.

(2) In 2 Kings xx. 7, and Isaiah xxxviii. 21, it may be carbuncle, or the bubo of the plague.

(3) In Job ii. 7, it may be black leprosy.

¶ In Deut. xxvii. 27, 35, the same word שִׁחִין (*shechin*) occurs, though translated *botch*.

"The flesh also, in which, even in the skin thereof, was a boil, and is healed. And in the place of the *boil* there be a white rising. . ."

**boiling point, boiling-point.**

**Physics, Chem., &c.:** The point or degree of the thermometer at which any liquid boils. [BOILINO.] The boiling point of any liquid is always the same, if the physical conditions are the same. It is altered by adhesion of the liquid to the surface of the vessel in which it is contained, or solution of a solid in the

liquid raises the boiling point. Increase of pressure raises, while diminution of atmospheric pressure lowers, the boiling point. The boiling point of distilled water under the pressure of 760 millimetres is 100° C., or 212° F. A difference of height of about 327 metres lowers the boiling point of water about 1° C., or 597 feet ascent lowers it 1° F. Whatever be the intensity of the source of heat, as soon as ebullition commences the temperature of the liquid remains stationary. The boiling point of organic compounds is generally higher as the constitution is more complex. In a homologous series the boiling point rises about 19° for every additional CH<sub>2</sub> in normal alcohols, and 22° in the normal fatty acids, as ethylic alcohol, C<sub>2</sub>H<sub>5</sub>(OH) 78.4°; propylic alcohol, C<sub>3</sub>H<sub>7</sub>(OH) 97°; acetic acid, CH<sub>3</sub>COOH 118°; propionic acid, C<sub>2</sub>H<sub>5</sub>COOH 149.6°. The secondary and tertiary alcohols have lower boiling points than the primary alcohols. The replacement of hydrogen in a hydrocarbon by chlorine, or by a radical, raises the boiling point, as benzene C<sub>6</sub>H<sub>6</sub>: 82°, chlorobenzene C<sub>6</sub>H<sub>5</sub>Cl 135°, amidobenzene C<sub>6</sub>H<sub>5</sub>(NH<sub>2</sub>) 182°.

"These are the very solutions, it will be remembered, which behave singularly in respect of their refractive indices, and also of their boiling points."—*Proceedings of the Physical Society of London*, p. 11, p. 60.

**Logic:** The fifth mood of the third figure of syllogisms. A being the universal affirmative and O the particular negative, bokardo has a particular negative in the major premise, a universal affirmative in the minor one, and the conclusion, if correctly drawn, will also have a particular affirmative. In logical formula some Y's are not X's, every Y is Z, therefore some Z's are not X's; as, not all the kings of the world are really kingly, all doubtless are called so by the courtiers who surround them, but this only shows that in some cases at least the interested statements of courtiers are wholly untrustworthy. Bokardo is sometimes called Dokamo.

BOLAS.

inhabitants of South America. In war a Patagonian uses a one-stone bolas, hurling the stone at his adversary while retaining the string in his own hand. The Esquimaux bolas is made of a number of walrus' teeth at the end of strings knotted together. For the bolas of the South Americans of remote European descent, see the example which follows.

The bolas, or balls, are of two kinds: the simplest, which is chiefly used for catching catiches, consists of two round stones, covered with leather, and united by a thin plaited thong about eight feet long. The other kind differs only in having three balls united by the thongs to a common centre. The Onoblo holds the smallest of the three in his hand, and whips the other two round and round his head; then, taking aim, sends them like chain-shot revolving through the air. The balls no sooner strike any object, than, winding round it, they cross each other, and become firmly hitched. The size and weight of the balls varies according to the purpose for which they are made.

When of stone, although not larger than an apple, they are sent with such force as sometimes to break the leg even of a horse. I have seen the balls made of wood, and as large as a turp, for the sake of catching these animals without injuring them. The balls are sometimes made of iron, and these can be hurled to the greatest distance. The main difficulty in using either iron or wood is to ride so well as to be able at full speed, and while suddenly turning about, to whirl them so steadily round the head as to take aim; on foot any person would soon learn the art. — *Darwin: Voyages round the World*, ch. lii, pp. 44, 45.

is positive; *fearlessness* is negative; *we may therefore be fearless* without being *bold*, or *fearless* through *boldness*. *Fearlessness* is a temporary state; we may be *fearless* of danger at this, or at that time, *fearless* of loss, and the like; *boldness* is a characteristic, it is associated with constant *fearlessness*. *Intrepidity* and *undauntedness* denote a still higher degree of *fearlessness* than *boldness*: *boldness* is confident, it forgets the consequences; *intrepidity* is collected, it sees the danger, and faces it with composure; *undauntedness* is associated with unconquerable firmness and resolution; it is awed by nothing. The bold man proceeds on his enterprise with spirit and vivacity; the intrepid man calmly advances to the scene of death and destruction; the undaunted man keeps his countenance in the season of trial, in the midst of the most terrifying and overwhelming circumstances." (*Crabb: Eng. Synon.*)

**II.** *Technically*:

1. *Physiol.*: A hard, dense, opaque substance used as the internal framework of man, the vertebrata and some cephalopoda, and as the external covering of several classes of animals. It is composed partly of an organic or animal, and partly of an inorganic or earthy material. In a child the earthy material is a trifle under half the weight of the bone, in an adult four-fifths, and in an old person seven-eighths. The animal part of bone consists of cartilage, with vessels, medullary membrane, and fat. Three hours' boiling will convert it into gelatine. The animal part consists of phosphate and carbonate of lime, with smaller portions of phosphate and carbonate of magnesia. The outer portion of a bone is in general compact and strong, the interior reticular, spongy, or cancellated, that is, having spaces or cells called cancelli communicating freely with each other. [CANCELLI.] The hard surface of bone is covered by a firm, tough membrane called the periosteum. [PERIOSTEUM.] In the compact tissue are vascular canals called Haversian Canals [HAVERSIAN.] There are in bone pores coalescing into a lacuna beneath. It has blood-vessels and nerves. Bones may be classified into *Long*, *Short*, *Flat*, and *Irregular*. (See *Todd & Bowman's Physiol. Anat.*, vol. I., ch. v., p. 103.) A long bone is divided into a shaft or central part and two extremities. (*Ibid.*) There are 198 bones in the fully developed human skeleton.

2. *Chem.*: Bones consist partly of animal and partly of earthy matter. The former is called ossein (q.v.). It yields gelatine on being boiled. The composition of human bones, as analyzed by Berzelius, is—

Animal matter soluble by boiling . . .	82.17
Vascular substance . . . . .	1.13
Calcium phosphate, with a little calcium fluoride . . . . .	53.04
Calcium carbonate . . . . .	11.30
Magnesium phosphate . . . . .	1.16
Soda, with a little common salt . . .	1.20

100.00

In the other vertebrates the proportions are slightly different.

3. *Paleont.*: Excepting teeth, no part of a vertebrate animal is more indestructible than bones, and these are so correlated to the teeth, digestive organs, external covering, &c., that in many cases the finding of a single bone will enable a skilled anatomist to reconstruct the whole animal.

4. *Music. Pl. (Bones)*: Four pieces of bone taken from the ribs of horses or oxen, and struck together for the purpose of marking time in accompaniment to the voice or an instrument. Sometimes only two bones are used, or in lieu of these two small wooden maces. The instrument is probably of African origin. It existed in Egypt as far back as the Theban era. Negro minstrels still patronize it. Country people call such bones knickyknackers (q.v.). (*Stainer & Barrett*.)

"Let's have the tongs and the bones."—*Shaksp.: Mid. Night's Dr.*, IV. 1.

5. *Weaving*: A kind of bobbin made of troller bones for weaving bonelace (q.v.) (*Johnson*.)

6. *Art*: Bones are used in many of the arts. See the example.

"Mechanically considered, the uses of bones are for framing, lining, handles of knives and tools, billiard balls, scales, &c. The term includes the ordinary bones of the body, and also the tusks and teeth of the elephant, hippopotamus, walrus, and whale. Bone is also, when deprived of the animal matters by distillation, used as a defecating, bleaching, and filtering material in the treatment of syrups and distilled liquors, and in the purification of water. Bone-black is also used as a pigment in making printer's ink. Bone, while yet fresh, is used by pastry-cooks to prepare a clear and rigid jelly. Bone is used by steel-workers as a carbon in the hardening of steel. Whalebone (so called) is not a bone, but partakes of the nature of horn. Bone is used by husbandmen as a manure. Bones bleached in an open fire, removing the carbon, yield a powder which is used in making the cupsels of the smelter, in making phosphors, and as a polishing material."—*Fruct. Diet. Medicar.*

**B.** *As adjective*: Of or belonging to bone.

*Geol.*: A dark-coloured bed, so called from the remains of saurians and fishes with which it abounds. It is seen at Axmouth in Devonshire, and in the cliffs of Westbury and Aust in Gloucestershire. It was formerly supposed to be the lowest stratum of the Lias, but Sir Philip Egerton showed, from the character of the fish remains, that it was really referable to the Upper Trias. Its characteristic fishes are *Acerodus*, *Hybodus*, *Gyrolepis*, and *Saurichthys*.

**bone-black**, *s.*

*Comm.*: Animal charcoal. It is obtained by charring bones. It contains about 10 per cent. of finely divided carbon disseminated through the porous phosphate of calcium. It has the power of absorbing gases, removing the colouring matter and alkaloïds, &c., from their solutions. It is used to disinfect ulcers, &c., also to decolorize sugar and other organic substances; its properties can be restored by heating it to redness in closed vessels. If treated with dilute hydrochloric acid, HCl, for two days the mineral matters are removed, and a black pulverulent substance is obtained, which has been used as an antidote in cases of poisoning with vegetable alkaloids.

¶ Among the volatile products obtained when bones are calcined in close vessels is a peculiar oil, which is burned in lamps in close chambers; while the soot which accumulates on the sides is collected and forms the pigment known, according to quality, as bone-black or ivory-black.

**Bood'-dha, Būd'-dha, s.** [Pali *boodho* = known, understood, possessing knowledge, enlightened, wise; *Boodha* = the personage described in this article. Sometimes the word is spelled with one *d*, but this is erroneous, *Boodh* in Sanscrit being = not the religious teacher but the planet Mercury.]

1. *Gen.:* A man possessed of infinite or infallible knowledge (*Childers*); a deified religious teacher. There was said to be a series of them, a number having come and gone before Gautama, the personage described under No. 2. When no Booddha is on earth, the true religion gradually decays, but it flourishes in pristine vigour when a new Booddha is raised up. He is not, however, entitled at once to that honourable appellation, it is only after he has put forth arduous exertions for the faith that he attains to Booddhahood. Most of the Booddhs preceding the personage described under No. 2 appear to have been purely fabulous. His immediate predecessor, Kasyapa or Kassapo, may have been a real person.

"... Sakya Muni, who is usually looked upon as the founder of Booddhism; but so far from this being the case Sakya Muni was the fourth Buddha of the actual age or second division of the Kappa.—*Col. Sykes in Jour. Asiatic Soc.* (1841), vol. vi., p. 261.

2. *Specialty:* A distinguished personage of Aryan descent, whose father was king of Kapilavastu, an old Hindoo kingdom at the foot of the Nepalese mountains, about 100 miles north of Benares: he was of the Sakhya family, and the class of the Gautamas, hence his distinguished son was often called Sakhya Muni or Saint Sakya, and Gautama or Guadama. The Chinese call him Fo, which is the name Booddha softened in the pronunciation. The Aryan invaders of India looked down with contempt upon the Turanian inhabitants of that land, and to keep their blood uncontaminated developed the system of caste. Booddha, whose human sympathy was wide-reaching, broke through this old restraint, and though he was himself an Aryan, preached the equality of races, a doctrine which the oppressed Turanians eagerly embraced. By the common account he was born in B.C. 622, attained to Booddhahood in 580, and died in 543, or in the opinion of some in B.C. 477, or even lower, have been contended for. Booddha became deified by his admiring followers. These images of an oriental god made of white marble, so frequently seen in English museums and even in private houses, are representations of Booddha.

**Bood'-dhism, Būd'-dhism, s.** [Sansk. & Pali *Boodha* (BOODHA), and Eng. suff. *-ism*.]

*Theol., Phil., & Hist.:* The system of faith introduced or reformed by Booddha. [BOOD-*DHA*.] In its origin Booddhism was a reaction against the caste pretensions of the Brahmans and other Aryan [ARVANS] invaders of India, and was therefore eminently fitted to become, as it for a long time was, the religion of the vanquished Turanians [TURANIAN]. As might have been anticipated, the equality of all castes was, and is, one of its most fundamental tenets. [CASTE.] Another tenet is the deification of men who, when raised to Booddhahood, are called Booddhas. Professors of the faith enumerate about one hundred of these personages, but practically confine their rever-

ence to about seven. Pre-eminent among these stands Booddha himself. Personally, he never claimed divine honours. It was his disciples who first entitled him Sakya Muni, *i. e.*, Saint Sakya. (For other names, such as Gautama, &c., given to him, see BOODHA.) As Gautama, though adored as a superhuman, is after all confessedly only a deified hero, it has been disputed whether his followers can be said to admit a Supreme Intelligence, Governor of this and all worlds. In philosophy, they believe the universe to be *mayā*, an illusion or phantom. The later Brahmanists do the same; but in the opinion of Krishna Mohun, Banerges, and others, these latter seem to have borrowed the tenet from the Booddhists rather than the Booddhists from them. Of the six schools of Hindu philosophy, those which Booddhism most closely approaches, are the Sankhya philosophy of Kapila, and the Yoga philosophy of Patanjali. Booddhism enjoins great tenderness to animal life. The felicity at which its professors aim in the future world is called *Nirvāna*, or, more accurately, *Nibbanam*. It has been disputed whether this means annihilation or blissful repose. Mr. Robt. Caesar Childers, in his dictionary of the Pali language, uses strong arguments in favour of the former view. Booddhism was attended by an enormous development of monasticism.

The language in which Gautama or Booddha taught was the *Māgadhi* or Pali, the language of Magadha, now called Bahar or Behar. [PALI.] It was a Prakrit or Aryan vernacular of a province, but has now been raised to the dignity of the Booddhist sacred tongue throughout the world. Gautama's followers believe that his sayings were noted down in the *Tripiṭaka*, or "Three Treasuries of Discipline, Doctrine, and Metaphysics," which constitutes the Booddhist scriptures. What their real age is has been a matter of dispute; the discovery by General Cunningham, in 1874, of allusions to them in the *Bharhut Sculptures*, which are of date third century B.C., is in favour of their genuineness and antiquity. [BOODHIST ARCHITECTURE.] This work is in Pali; the Sanscrit Booddhist books discovered by Brian Hodgson in Nepal are much more modern, and present a corrupt form of Booddhism.

The first general council of the Booddhist Church was held at Rajagriha, the capital of the Magadha kingdom, in B.C. 543; the second at Vesali (Ahabad [?], or a place near Patna) about B.C. 443 or 377 (?), and a third at Pataliputra (Gr. Palibothra = modern Patna), on the Ganges, in B.C. 307 or 250. This last one was called by Asoka, an emperor ruling over a great part of India, who had been converted to Booddhism, and is sometimes called the Constantine of that faith, having established it as the state religion of his wide realm. He sent missionaries into Western, Central, and Southern India, and also to Ceylon and to Pegu. Booddhism was dominant in India for about 1,000 years after its establishment by Asoka. Then, having become corrupt and its vitality having decayed, reviving Brahmanism prevailed over it, and all but extinguished it on the Indian continent, though a modification of it, Jainism, still exists in Marwad and many other parts. It has all along held its own, however, in Ceylon. On losing continental India its missionaries transferred their efforts to China, which they converted, and which still remains Booddhist. The religion of Gautama flourishes also in Tibet, Burmah, and Japan, and is the great Turanian faith of the modern as of the ancient world. [BOODHISTS.]

The Rev. G. Smith points out resemblances between Booddhism and Roman Catholicism (these, it may be added, were first discovered by the Jesuit missionaries, who were greatly perplexed by them): "There is the monastery, celibacy, the dress and caps of the priests, the incense, the bells, the rosary of beads, the lighted candles at the altar, the same intonations in the services, the same ideas of purgatory, the praying in an unknown tongue, the offerings to departed spirits in the temple. The closest similarity is in Lamsism, an application of Booddhism in Tibet. [LAMASISM.] But most of the resemblances are ceremonial; there is no close similarity in doctrine between the two faiths.

"There is also something stronger than a presumption of the existence of *boodhism* previous to Sakya Muni's ministry.—*Col. Sykes in Jour. Asiatic Soc.*, vi. 261.

**A. As adjective:** Pertaining or relating to Booddha or to Booddhism.

**B. As substan.:** One professing the Booddhist faith. The Booddhists are not less than from 350 to 455 millions in number, and constitute between one-fourth and one-third of the human race.

"Pali then is the language of Magadha, in which Gautama Buddha taught, and in which the sacred scriptures of the Booddhists were originally written.—*Times*, Dec. 2, 1874.

**Booddhist architecture, s.**

*Arch.:* A style of architecture characteristic of the Indian or other Booddhists. "There is no known specimen of architecture in India," Mr. Ferguson says, "the date of which carries us beyond the third century before Christ." When the curtain rises the architecture visible is Booddhist. In 250 B.C. the great emperor Asoka introduced the first great era of Indian architecture, that of the Booddhists proper. Up till this time all erections had been wood; with him the use of stone commenced. He engraved edicts, enjoining tenderness and humanity to animals, on *lals* (pillars) [LAT] in Cuttack, Peshawur, and Screstra, in the Dhun or Dhop, and other parts of the Himalayas and in Thibet. He built innumerable *topes* (mounds). [TOPE.] No built temples or monasteries of Booddhist origin have come down to our times, if indeed any ever existed; but multitudes of rock-cut temples and monasteries assembled in groups have been found in Behar, Cuttack, the Bombay presidency, and elsewhere. Those of Behar, which are cut in granite, are the oldest, and it is from *bihar* = a monastery, that Behar itself is called. Those of Cuttack followed. Those of the Bombay presidency, embracing nine-tenths of the whole, were the last; they are cut in amygdaloidal trap. The Booddhist architecture, though essentially independent, yet showed a tinge of Greek influence. It originated the Jaina system of architecture. [JAINA ARCHITECTURE.] (*Ferguson*.)

S. *buok*; (N. H.) Ger. *buch*; M. H. Ger. *buoch*; O. H. Ger. *pohta*. From A.S. *bōc* = a beech; Ger. *buche* = a beech (BEECH), because Anglo-Saxon and German books were originally made of beech boards.]

**A. As substantive:**

**I. Ordinary Language:**

1. *Literally:*

(1) *Of things material:* An article of manufacture, of which a series of forms have existed in bygone ages, but which at present consists of a number of sheets of printed paper stitched together, pressed, and covered with boards. [BOOKBINDING.]

¶ The first books were probably of various and diverse types. The Koran is said to have been written on shoulder-blades of sheep. The Anglo-Saxon books were originally written on pieces of beechen board. Boards of other trees were doubtless used in other countries, as was the inner bark of trees. At a remote period of antiquity the papyrus [PAPYRUS] displaced its rivals, and so well held its place as to have given rise to the word *paper*. Parchment, called from Pergamos, where it was first made, arose about B.C. 200. [PARCHMENT.] An early and persistent form of book was a roll of papyrus or other material. Jeremiah's book was such a roll (Jer. xxxvi. 4, 14, 23). The charred books found in Herculaneum were also rolls. This form of book is commemorated in the common word *volume*, which

**fāte, fāt, fāre, amidst, whāt, fāl, father; wē, wēt, hēre, camēl, hēr, thēre; pine, pīt, sire, sir, marine; gō, pōt, or, wōre, wōlf, wōrk, whō, sōn; mūte, cūb, cūre. unite. cūr. rāle. fūll: trv. Svrian. s. ce = ā. ev = ā. au = kw.**

is from Lat. *volumen* = a thing rolled or unrolled. [VOLUME.] When books were transcribed by hand they were necessarily very expensive. Plato is said to have given about £312 for one, Aristotle about £560 for another; Alfred the Great, about the year 872, an estate for a third volume. Printing cheapened books to an incalculable extent, though heavy prices are still given for rare and large or copiously-illustrated works. Thus Machlin's Bible, by Tomkins, was valued at \$525, and a superb Bible, in fifty-four large folio volumes, with 7,000 illustrations, was raffled off for tickets in the aggregate amounting to £5,000. A collection of books is called a library. [LIBRARY.]

In another form, the book is clamped and a roller passed over the back under great pressure. Another form of machine is for moulding the back-covers of books to a given curvature, by pressing between a heated cylinder of a given radius and a bed-plate whose curvature corresponds to the presser. **book-bind-ing, a.** [Eng. *book; binding.*] The art of stitching or otherwise fastening together and covering the sheets of paper or similar material composing a book. The edge of a modern book constituted by the margin of the paper composing it is called the *binding-edge*.

¶ When books were literal "volumes," or rolls, the way of "binding" them, if it could be so called, or at least of keeping them together, was to unroll them from one cylinder and roll each again, as it was perused, on

another. When books became separate folios the first method of dealing with them seems to have been the tying them together by a string passed through a hole at the margin of the pile. This is still done in the south of India and Ceylon with writing on talipot or other palm leaves. This holding together of folios of a literary man's manuscript by a small clasp at one edge is an essentially similar device. The present method of binding seems to have been invented by or under Aëtlius, king of Pergamus, or his son Eumenes, about 200 B.C. The oldest bound book known—the binding was the dominant—is the volume of St. Cuthbert, about A.D. 650. Ivory was used for book covers in the eighth century; oak in the ninth. The *Book of Evangelists*, on which the English kings took their coronation oath, was bound in oak boards, A.D. 1100. Velvet, silk, hogskin, and leather were used as early as the 15th century; needlework binding began in 1471; vellum, stamped and ornamented, about 1510; leather about the same date, and calf in 1550. Cloth binding superseded the paper known in England as "boards" in 1823; india-rubber backs were introduced in 1841, tortoise-shell sides in 1856.

The chief processes of bookbinding are the following: Folding the sheets; gathering the consecutive signatures; rolling the packs of folded sheets; sewing, after saw-cutting the backs for the cords; rounding the backs and gluing them; edge-cutting; binding, securing the book to the sides; covering the sides and back with leather, muslin, or paper, as the case may be; tooling and lettering; and, finally, edge-gilding. Books may be *full bound*, *i.e.*, with the back and sides leather, or *half-bound*, that is, with the back leather and the sides paper or cloth.

**I. Arithm. & Comm.:** The art of keeping books in which the pecuniary transactions are so unremittingly and so accurately entered that one is able at any time to ascertain the exact state of his financial affairs or of any portion of them with clearness and expedition. The art, in a certain undeveloped state, must have existed from immemorial antiquity, but it received such improvement and impulse at Venice as to make that comparatively modern city to be considered its birthplace. The first known writer on bookkeeping was Lucas di Borgo, who published a treatise on the subject in Italian in 1495. It is generally divided into bookkeeping by single and bookkeeping by double entry. In the former every entry is single, *i.e.*, is placed to the debit or credit of a single account, while in the latter it is double, that is, it has both a debtor and creditor account. In other words, by single entry each transaction is entered only once in the ledger, and by double entry twice. Bookkeeping by single entry is imperfect, and is scarcely fitted even for very limited establishments. Many shopkeepers having recourse to it have simply a waste-book and a journal, the former used as a receptacle for transactions of all kinds, the latter for those to a certain extent classified. In other cases a cash-book also is used. Bookkeeping by double entry being first practised in Venice, Genoa, and the adjacent towns, is often called the Italian method. In bookkeeping by double entry there is no waste-book, all transactions inwards falling under four heads: cash, bills, book-debts, and stock. There are, moreover, a cash-book, a bill-book, a book for book-debts—called the sold ledger—and a book for the record of stock, that is, stock in hand. To the bought book for debts receivable corresponds the bought ledger for debts payable. There are various other books in a large establishment. In smaller establishments it is enough to have a cash-book, a day or waste-book, a journal, and a ledger. It is in the ledger that the elaborate classification of all transactions is entered. The ability to make out a balance-sheet is much increased by the simple device of making impersonal entries, that is, entering cash, iron, &c., as if they were mercantile traders, and grouping a number of articles together under the heading sundries. Then there are accounts of the firm sundries debtor to cash, or cash debtor to sundries. If a merchant have purchased iron, what he has paid for it is debited to iron which is expected to meet it when the metal is disposed of, and so with every other expense incurred by the firm for purposes of business.

Sometimes instead of bookkeeping by single or that by double entry, there is a combination of the two called *mixed entry*. [*BILL-BOOK, CASH-BOOK, DAY-BOOK, LEDGER.*]

the lowest in intelligence of any tribe or race of mankind. It is a curved stick, round on one side and flat on the other, about three feet long, two inches wide, and three-quarters of an inch thick. It is grasped at one end and thrown sickle-wise, either upward into the air, or downward so as to strike the ground at some distance from the thrower. In the first case it flies with a rotatory motion, as its shape would indicate, and after ascending to a great height in the air, it suddenly returns in an elliptical orbit to a spot near its starting-point. On throwing it downward to the ground, it rebounds in a straight line, pursuing a ricochet motion until it strikes the object at which it is thrown. The most singular curve described by it is when it is projected upward at an angle about 45°, when its flight is always backward, and the native who throws it stands with his back to the object he intends to hit. **A. As substantive:**

1. **Ordinary Languages:** The brim, edge, margin, or boundary line of anything. *Spec.*—

1. *Of earthenware, a looking-glass, a picture, &c.:* The brim, the margin, the frame, or anything else surrounding it.

(3) *Of a lake:* Its bank or margin.

"It was situated on the borders of an extensive but shallow lake. . . ."—*Darwin: Voyage round the World* (ed. 1870), ch. vi, p. 114.

¶ (1) Crabb thus distinguishes between *border*, *edge*, *rim* or *brim*, *brink*, *margin*, and *verge*: "Of these terms, *border* is the least definite point, *edge* the most so; *rim* and *brim* are species of *edge*; *margin* and *verge* are species of *border*. A *border* is a stripe, an *edge* is a line. The *border* lies at a certain distance from the *edge*; the *edge* is the exterior termination of the surface of any substance. Whatever is wide enough to admit of any space round its circumference may have a *border*; whatever comes to a narrow extended surface has an *edge*. Many things may have both a *border* and an *edge*; of this description are caps, gowns, carpets, and the like; others have a *border* but no *edge*, as lands, and others have an *edge* but no *border*, as a knife or table. A *rim* is the edge of any vessel; the *brim* is the exterior edge of a cap; a *brink* is the edge of any precipice or deep place; a *margin* is the border of a book or a piece of water; a *verge* is the extreme border of a place."

(2) *Border*, *boundary*, *frontier*, and *confines*

are thus discriminated: "These terms are all applied to countries or tracts of land." The "*border* is the outer edge or tract of land that runs along a country; it is mostly applied to countries running in a line with each other, as the *borders* of England and Scotland; the *boundary* is that which bounds or limits, as the *boundaries* of countries or provinces; the *frontier* is that which lies in the front or forms the entrance into a country, as the *frontiers* of Germany or the *frontiers* of France; the *confines* are the parts lying contiguous to others, as the *confines* of different states or provinces. The term *border* is employed in describing those parts which form the *borders*, as to dwell on the *borders* or to run along the *borders*. The term *boundary* is used in speaking of the extent or limits of places; it belongs to the science of geography to describe the *boundaries* of countries. The *frontiers* are mostly spoken of in relation to military matters, as to pass the *frontiers*, to fortify *frontier* towns, to guard the *frontiers*, or in respect to one's passage from one country to another, as to be stopped at the *frontiers*. The term *confines*, like that of *borders*, is mostly in respect to two places; the *border* is mostly a line, but the *confines* may be a point; one therefore speaks of going along the *borders*, but meeting on the *confines*." "The term *border* may be extended in its application to any space, and *boundary* to any limit. *Confines* is also figuratively applied to any space included within the *confines*, as the *confines* of the grave; *precinct* is properly any place which is encircled by something that serves as a girdle, as to be within the *precincts* of a court, that is, within the space which belongs to or is under the control of a court." (*Crabb: Eng. Syn.*)

1. A tidal wave running with fearful height and velocity up various rivers. In India it occurs on the Ganges and the Indus, but, according to an "Anglo-Burman," is nowhere better seen than in the Sittang between Rangoon and Monleim in the Eastern Peninsula. In Britain a bore rushes at spring tides up the Bristol Channel from the Atlantic, and being narrowed by the funnel-shaped estuary of the Severn, rises into a bore below Newnham, and does not entirely expend its force till it has passed Gloucester. It affects also the river Parrett, just below Bridgewater, and other rivers which run into the Bristol Channel. There is a bore also in the Solway. [EAORE, HYORE.]

"The bore had certainly alarmed us for ninety or a hundred seconds." - De Bistroy: Works, 2nd ed., 1, 168.

2. Less properly: A very high tidal wave, not, however, so abrupt as in No. 1, seen in the English Channel, the Bay of Fundy, &c. [Dana.]

boric acid, boracic acid, s.

1. Chem.: Boric acid, or orthoboric acid,

B(OH)<sub>3</sub>, is formed by dissolving boron trioxide (B<sub>2</sub>O<sub>3</sub>) in water. It occurs in the steam which issues from volcanic vents in Tuscany called soffioni, or fumaroles. These are directed into artificial lagoons, the water of which becomes charged with boric acid, and it is obtained from it by evaporation. Boric acid is supposed to be formed by the action of water on BN (nitride of boron), which is decomposed by it into boric acid and ammonia. Boric acid crystallizes out in six-sided laminae, which are soluble in hot water and in alcohol; it forms salts and borates, which are very unstable, as Mg<sub>3</sub>(BO<sub>3</sub>)<sub>2</sub> (magnesium orthoborate), being a tribasic acid. Its solution in alcohol burns with a green-edged flame. Boric acid turns litmus paper brown, even in the presence of free hydrochloric acid; the brown colour thus formed is turned a dirty blue by caustic soda. Pyroboric acid, H<sub>2</sub>B<sub>3</sub>O<sub>7</sub>, is obtained by heating for a long time the crystals of orthoboric acid at 140° C. Its chief salts are borax, Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>, sodium pyroborate, and Ca<sup>2</sup>B<sub>2</sub>O<sub>7</sub> calcium pyroborate, which occurs as the mineral boracelite. Metaboric acid, B<sup>2</sup>O(OH), is formed when boric acid is heated to 100°; it is a white powder. Its salts are called metaborates; as, barium metaborate, Ba<sup>2</sup>(BO<sub>3</sub>)<sub>2</sub>; and calcium metaborate, Ca<sup>2</sup>(BO<sub>3</sub>)<sub>2</sub>, a white powder precipitated when CaCl<sub>2</sub> is added to a solution of borax; the calcium salt is soluble in acetic acid, and in NH<sub>4</sub>Cl.

A brace is on the dividing line, if such there be, but is not included under the term boring-machines. (*Knight*.)

**boring mollusca, s.** The principal boring mollusca are the Terebo, which perforates timber, and Pholas, which bores into chalk, clay, and sandstones. These shells are supposed to bore by mechanical means, either by the foot or by the valve. But certain shells, as Lithodomus, Gastrochaena, Saxicava, and Ungulina, which attack the hardest marble and the shells of other mollusca, have smooth valves and a small foot, and have a limited power of movement—the Saxicava is even fixed in its crypt by a byssus—so they have been supposed either to dissolve the rock by chemical means, or else to wear it away with the thickened anterior margins of the mantle. The boring mollusks have been called "stone-eaters" (*Lithophagi*), and "wood-eaters" (*Zylophagi*), and some at least are obliged to swallow the material produced by their operations, though they derive no nourishment from it. No boring mollusk deepens or enlarges its burrow after attaining the full growth usual to its species. The animals do great injury to ships, piers, and breakwaters.

Borneol forms small transparent crystals, smelling like camphor and pepper; melting at 198° and boiling at 212°. Its alcoholic solution is dextrorotatory. Heated with nitric acid it is converted into ordinary camphor.

**bör-ön, s.** [From *borax* (q.v.).]

*Chemistry:* A triatomic element, symbol B. At. Wt. 11. It occurs in nature combined in the form of boric acid B(OH)<sub>3</sub> and its salts. Boron is obtained by fusing boric trioxide B<sub>2</sub>O<sub>3</sub> with sodium. It is a tasteless, inodorous, brown powder, a non-conductor of electricity; it is slightly soluble in water, permanent in the air; burnt in chlorine gas it forms boron chloride BCl<sub>3</sub>, a volatile, fusing liquid, boiling at 18.23, sp. gr. 1.35; it is decomposed by water into boric acid and hydrochloric acid. When amorphous boron is heated with aluminum the boron dissolves in it, and separates out as the metal cools. The aluminum is removed by caustic soda. It crystallizes in monoclinic octahedra, which scratch ruby and corundum, but are scratched by the diamond; the sp. gr. is 2.68. Heated in oxygen it ignites, and is covered with a coating of brown trioxide. Amorphous boron, fused with nitrate of potassium, explodes. Boron forms one oxide B<sub>2</sub>O<sub>3</sub>, obtained by heating boric acid to redness; it forms a glassy, hygroscopic, transparent solid, volatile at white heat. It dissolves metallic oxides, yielding coloured beads (see *Borax-beads*). Boron unites with fluorine, forming a colourless gas BF<sub>3</sub>, having a great affinity for water. It carbonizes organic bodies; 700 volumes are soluble in one volume of water, forming an oily fusing liquid. Amorphous boron combines directly with nitrogen, forming boron nitride BN, a light amorphous white solid which, heated in a current of steam, yields ammonia and boric acid.

bot-fly, s.

Entomology:

1. *Singular*: One of the names given to any species of the genus *Cestrus*, or even of the family *Cestridae*. These insects are sometimes called also *Breeze-flies*, *Brize-flies*, and *Gad-flies*, the last of these names not being a properly distinctive one, for it is applied also to the *Tsambidae*, a totally distinct family of dipterous insects. The bot-fly, which has attracted most notice, is *Gasterophilus equi*, often called the gad-fly of the horse. It is a downy two-winged fly, which in August deposits from 50 to 100 eggs on the legs, the back of the neck, and other parts of a horse accessible to the animal's tongue. Slightly irritated by them the horse licks the part affected, with the effect of bursting the egg and transferring the minute larvæ to its mouth, whence they make way to the stomach and grow to be an inch long. They are ejected with the food, spend their chrysalis state in the earth or dung, and emerge perfect insects but with no proboscis capable of being used for feeding purposes. It is not food they require, it is to propagate their species and die. A similar

bot-an-y, s. & a. [Gr. *Botanē* (*botanē*) = grass-fodder; *βόσκω* (*boskō*) = to feed, to tend cattle or sheep.]

A. As *substan.*: The science which treats of plants. It embraces a knowledge of their names, their external and internal organizations, their anatomy and physiology, their qualities, their uses, and their distribution over the world, with the laws by which this distribution is regulated, or the geological occurrences by which it has been brought about.

History: From the remotest antiquity plants must have been at least looked at, and to a certain extent studied; and it is reported in Scripture regarding Solomon, that "he spake of trees, from the cedar tree that is in Lebanon even unto the hyssop that springeth out of the wall" (1 Kings iv. 33). If his sayings on that subject were put in writing they have perished; the first important scientific notices regarding plants which have reached our time are in Aristotle's *Inquiries Concerning Animals*, about B.C. 347. Theophrastus, who succeeded him in B.C. 324, gave great attention to plants, knowing, however, it is said, only about 355. Pliny, among the Romans, was also interested in botanical study, as in natural history generally. The Arabs gave more attention to botany; but up to the year A.D. 1231, according to Sprengel, only about 1,400 plants were known. After the revival of letters, Conrad Gesner, who died in 1565, collected materials and made drawings for a history of plants. Matthew Lobel, a Dutchman at the court of Queen Elizabeth, attempted a natural classification of plants, and some of his orders are still retained. Cæsalpinus, a Roman physician attached to the court of Pope Sixtus VI., made various botanical discoveries. About A.D. 1650, the microscope began to be used for the examination of plants. Grew and Malpighi flourished in the same century; and in 1686 Ray published the first volume of his *Systema Plantarum*. About 1735, Linnæus gave to the world his celebrated *Systema Naturæ*, the botanical portion of which contains his artificial system, which is even now obsolete rather than obsolete. As a rule, his classes were founded on the number, position, &c., of the stamens, and his orders on the number and character of the pistils. He founded twenty-four classes, viz., (1) Monandria, (2) Diandria, (3) Triandria, (4) Tetrandria, (5) Pentandria, (6) Hexandria, (7) Heptandria, (8) Octandria, (9) Eneandria, (10) Decandria, (11) Dodecandria, (12) Icosandria, (13) Polyandria, (14) Didynamia, (15) Tetradynamia, (16) Monadelphica, (17) Diadelphica, (18) Polyadelphia, (19) Syngeneia, (20) Gyn-

andria, (21) Monœcia, (22) Dioœcia, (23) Polygamia, and (24) Cryptogamia. (See these words for further details, and for the orders into which the several classes are divided.) Besides his artificial system of classification Linnæus attempted a natural one. In 1789, Antoine Laurent de Jussieu published his *Genera Plantarum*, in which, following in the direction in which Lobel, Ray, and Linnæus himself had led, he elaborated a natural system, the essential features of which are still retained. In Lindley's *Vegetable Kingdom*, published in 1867, the classification is as follows: Class I. Thallogens, II. Acrogens, III. Rhizogens, IV. Endogens, V. Dictyogens, VI. Gymnogens, and VII. Exogens.

Modern botany, or phytology, as it is sometimes called, comprises a number of subordinals sciences.

Lindley, in the main following Decandolle, divided it into Organography, or an explanation of the exact structure of plants; Vegetabilia Physiology, or the history of vital phenomena which have been observed in them; Glossology, formerly called Terminology, or a definition of the adjective terms used in botany and phytology, or an exposition of the rules to be observed in describing and naming plants. (*Introd. to Bot.*, 3rd ed., 1839, Pref.) All these are introductory to Systematic Botany, which is the classification and description of the several classes, orders, families, genera, species, varieties, &c., of plants in regular arrangement.

Thomé, author of the recognised text-book of botany in use in the technical schools of Germany, divides the science into—1. Morphology, or the Comparative Anatomy of Plants; 11. Physiology, which is concerned with their vital phenomena; 111. Botanical Geography; IV. Palæobotany; V. Vegetable Palæontology; VI. Classification of Plants; and VII. Practical or Applied Botany.

Robt. Brown, jun., in his *Manual of Botany*, published in 1874, divides it into—1. General Anatomy or Histology of Plants; 1. Organography, 2. Morphology, 3. Organogenesis, 4. Phytotomy; 11. Physiological Botany; 111. Vegetable Chemistry; IV. Nosology, or Vegetable Pathology; V. Teratology, a study of abnormalities; VI. Taxology, Taxonomy, Classification, or Systematic Botany; 1. Terminology, 2. Glossology; VII. Phyto-geography; VIII. Palæo-phytology, Geological Botany, Vegetable Palæontology, or Fossil Botany; IX. Medical Botany; X. Agricultural Botany; XI. Horticultural Botany; and XII. Industrial Botany. (See these terms. See also PLANT, VEGETABLE KINGDOM, &c. &c.)

It is much used on the coasts of the Mediterranean as an incentive to drink.

The mullet (mugil) is a fish which is caught about the middle of December; the hard roe of it are salted against Lent, and this is what is called *botargues*, a sort of *botargues* (puddings), which have nothing to recommend them but their exciting of thirst."

From Sw. buller = noise; Dan. bulder = noise, tumbling noise, bustle, brawl. So called from the noise which boulders make when rolled over a rocky or pebbly beach by a stormy sea or a river in flood.]

A. As substantive:

I. Ord. Lang. (of the form boulder): A word of Scandinavian origin, used, according to Jamieson, in Perthshire, where the term "boulder-stane" was applied to "the large single stones found in the earth by which they make roads." Probably the term was also employed elsewhere than in Perthshire.

II. Geol. (of the form boulder): The adoption by geologists of the local word boulder has given it universal currency. It is used to signify a large, rounded block of stone, which, whether lying loose on the surface of the ground or imbedded in the soil, is of different composition from the rocks adjacent to which it now rests, and must, therefore, have been transported from a lesser or greater distance. From the last-mentioned facts, boulders are often called erratic blocks, or, simply, erratics. [BOULDER-FORMATION, BOULDER-PERIOD.]

B. As adjective: Marked by the presence of boulders; acting as boulders do.

boulder-formation, boulder formation, s.

Geol.: A formation consisting of mud, sand, and clay, more frequently unstratified than the reverse, generally studded with fragments of rocks, some of them angular, others rounded, with boulders scattered here and there through the mass. When unstratified, it is called in Scotland till (q.v.). As much of the material has been transported from a greater or less distance, it is sometimes called drift. The old name diluvium, being founded on now-abandoned hypotheses, has become obsolete. [DILUVIUM.] The formation exists only from the poles to about 40° of latitude, unless where the Alps or other high mountains in warmer climes have originated boulder formations of their own. The nearer the poles one travels the larger are the erratic boulders. The rocks on which they rest are furrowed and scored with lines, as if ice with stones projecting from its surface had heavily driven over them. [GLACIATION.] Fossils, where they exist, indicate a very cold climate. [BOULDER-PERIOD.]

Cf. also Wel. *bona* = stem, base, stock; Gael. *bonn* = a sole, a foundation, bottom, base.] A boundary, a limit, a confine. *Used—*

**I. Lit.: Of material limits:**  
(1) Set up or conventionally arranged by man.

"Assyria, and her empire's ancient bounds."—*Milton: P. R., bk. III.*

"He hath compassed the waters with bounds, until the day and night come to an end."—*Job xxi. 16.*

**2. Fig.: Of limits not formed by any material thing:**  
"And hast thou cross'd that unknown river,  
Life's dreary bound?"—*Burns: Elegy on Captain M. Henderson.*

Crabb thus distinguishes between *bounds* and *boundary*:—"Bounds is employed to designate the whole space including the outer line that confines; *boundary* comprehends only this outer line. *Bounds* are made for a local purpose; *boundary* for a political purpose: the master of a school prescribes the *bounds* beyond which the scholar is not to go; the parishes throughout England have their *boundaries*, which are distinguished by marks; fields have likewise their *boundaries*, which are commonly marked out by a hedge or a ditch. *Bounds* are temporary and changeable; *boundaries* permanent and fixed: whoever has the authority of prescribing *bounds* for others, may in like manner contract or extend them at pleasure; the *boundaries* of places are seldom altered, but in consequence of great political changes. In the figurative sense *bound* or *bounds* is even more frequently used than *boundary*: we speak of setting *bounds* or keeping within *bounds*; but to know a *boundary*: it is necessary occasionally to set *bounds* to the inordinate appetites of the best disposed children, who cannot be expected to know the exact *boundary* for indulgence." (*Crabb: Eng. Syn.*)

**bound** (**1**), **\*bōwnd**, *v.t.* [From **bound** (**1**), *s.* (q.v.).]  
**I. Ordinary Language:**  
1. To limit, to terminate. *Used as limits—*  
(1) Produced by material obstacles preventing extension.  
"Of that magnificent temple which doth bound  
One side of our whole vale with grandeur rare."  
*Wordsworth: Farewell.*

(2) Produced by obstacles to extension or advancement not of a material character.  
"Thus Heaven, though all-sufficient, allows a thrift  
In his economy, and bounds his gift."  
*Dryden: Eteonora, 75-76.*  
"Vast was his empire, absolute his power,  
Or bounded only by a law."  
*Cooper: Task, bk. vi.*

2. To indicate the boundaries of.  
**II. Geom.:** In the same sense as No. 1.  
"That which bounds a solid is a superficies."—*Euclid, bk. xi, def. 2.*  
"Crabb thus distinguishes between the verbs to bound, to limit, to confine, to circumscribe, to restrict:—"The first four of these terms are employed in the proper sense of parting off certain spaces. *Bound* applies to the natural or political divisions of the earth: countries are bounded by mountains and seas; kingdoms are often bounded by each other."  
"Limit applies to any artificial boundary: as landmarks in fields serve to show the limits of one man's ground from another; so may walls, palings, hedges, or any other visible sign, be converted into a limit, to distinguish one spot from another, and in this manner a field is said to be limited, because it has limits assigned to it. To confine is to bring the limits close together; to part off one space absolutely from another: in this manner we confine a garden by means of walls. To circumscribe is literally to surround: in this manner a circle may circumscribe a square; there is this difference however between confine and circumscribe, that the former may not only show the limits, but may also prevent egress and ingress; whereas the latter, which is only a line, is but a simple mark that limits. From the proper acceptance of these terms we may easily perceive the ground on which their improper acceptance rests: to bound is an action suited to the nature of things or to some given rule; in this manner our views are bounded by the objects which intercept our sight: we bound our desires according to principles of propriety. To limit, confine, and circumscribe, all convey the idea of control which is more or less exercised. . . . In as much as all these terms convey the idea of being setted upon involuntarily, they become allied to the term restrict, which simply expresses the exercise of control on the will: we use restriction when we limit and confine, but we may restrict without limiting or confining: to limit and confine are the acts of things upon persons, or persons upon persons; but restrict is only the act of persons upon persons. . . . Bounded is opposed to unbounded, limited to extended, confined to expanded, circumscribed to simple, restricted to unshackled." (*Crabb: English Synon.*)

**bound** (**2**), *v. i. & t.* [From Fr. *bondir* = to leap; O. Fr. *bondir, bundir* = to rebound; connected with Lat. *bombito* = to buzz, to hum; *bombus* = a humming, a buzzing.] (**BOMBUS, BOOM.**)

II. *Technically*:

1. *Ch. & Civ. Hist.*: A grant or benefaction from the state to those whose services indirectly benefit it, and to whom, therefore, it desires to accord some recompense, or at least recognition.

† *Queen Anne's Bounty*: A bounty to the more poorly-endowed livings in the English Church. It was conferred by a royal charter confirmed by Queen Anne (2 Anna, ch. 11), and provides that all the revenue of first-fruits and tenths shall be vested in trustees for ever, and used as a perpetual fund for augmenting the endowments of poorer livings, and for advancing money to incumbents for rebuilding parsonages thereon. The trustees administering it have been formed into a corporation, and when applied to for grants act on rules which they have framed for the administration of the trust.

2. *Law, Comm., & Polit. Econ.*: A premium paid by Government to the producers, exporters, or importers of certain articles, or to those who employ ships in certain trades. This is done either with the view of fostering a new trade during its infancy, or of protecting an old one which is supposed to be of special importance to the country. The history of bounties affecting general commerce naturally divides itself into two periods. During the first of these, statesmen, and the educated classes generally, believed in the advantage of bounties, and they were paid on the exportation of corn, of linen, and other commodities, and in connection with the herring and whale fisheries. They were denounced by Adam Smith and other political economists. To tax the general public that goods may be benevolently furnished to the foreigner at unremunerative rates cannot possibly make a nation richer and if a manufacture or a fishery cannot pay its way unaided, it should be abandoned, and the money which it has locked up be turned into more profitable channels. These views having been adopted by the English Parliament, the bounty on the exportation of corn was abolished in 1815, and that on the exportation of linen and several other articles in 1830. In the last-mentioned year the bounty on the exportation of herrings was swept away, that paid on the tonnage of the vessels employed in whale-fishing having ceased in 1824.

The second period in the history of bounties

affecting British commerce is in certain respects the antithesis of the former one. The British manufacturer, standing manfully on his own resources, is in certain cases exposed to unduly severe competition, bounties to the foreign manufacturer enabling him to send his goods into the country at rates which he would otherwise find unremunerative. The system is now before the public in connection with the home and colonial sugar industries. The sugar duty in France and America is levied on the raw sugar, before it undergoes the process of refining. If the French or American manufacturer export refined sugar, the duty previously levied on the raw material is returned under the name of drawback, and as it is difficult to know how much raw sugar was used in making a certain weight of the refined article, he so takes the benefit of the doubt as to obtain a greater drawback on a given quantity than the duty he paid upon it in its raw state. The excess—in other words the profit, which he makes from the public treasury of his country, is the export "bounty." The same system obtains in Holland and Belgium, besides which the beetroot sugar manufacturers of these countries, together with those of Austria, Germany, and Russia, obtain a similar bounty on beetroot sugar. In Germany, Austria, and Russia the duty is levied on the weight of the root; in Belgium, on the density of the juice. In Austria and Russia the weight of the root is estimated according to the capacity of the apparatus. Under such systems a large portion of the sugar produced entirely escapes taxation, and as the full drawback is allowed on all sugar exported, the result is a large bounty on exportation.

In the United States, the McKinley Tariff Bill, which removed the duty from imported sugar, placed the American sugar producer, with whom the natural advantage for sugar cane culture were less favorable than in the West Indies, under a disadvantage. To obviate this, and also to encourage the development of the beetroot sugar industry, a bounty was granted to the sugar producer, sufficient to overcome the disadvantage named. The term bounty was also employed to designate the sums paid to induce enlistment during the Civil War, and to obtain substitutes for drafted men. These men frequently deserted, and were then known by the title of BOUNTY-JUMPER.

The same term is applied in the United States to grants of land to soldiers and sailors, their widows and children, for services in the army and navy. It is also applied to sums of money paid by government to owners of fishing vessels, by Act of Congress of July 29, 1813, for the encouragement of the fishing industry, and to sums of money appropriated for the destruction of wild beasts during the time that the country was sparsely settled. The amounts paid to companies which carry the mail by land or water have been called bounties, but a more proper term for them is that of appropriations for carrying the mails.

She taught that religion consisted in internal emotions, not in knowledge or practice. The Scottish General Assembly censured these tenets in 1701.

Entom.: A large group of beetles characterized by having the elytra so short that they do not nearly cover the abdomen. Some make them a subsection of Pentameria, the tarsi of most, though not all, of the genera being five. Others, we think more justly, consider them a section by themselves, connecting the Coleoptera with the Dermaptera (Earwigs). The Brachelytra have large membranous wings folded under the small elytra. They fly well. They are sometimes called Cocktails, from a habit they have of setting up their tails in a threatening attitude when menaced. The families are Pselaphidae, Tachyporidae, Staphylinidae, Stenidae, and Omalidae (q.v.).

Zool. & Paleont.: One of the great classes into which the molluscous sub-kingdom of the animal kingdom is divided. The Brachiopoda are bivalves, with one shell on the back of the animal, and the other in front: these are called dorsal and ventral valves. The two valves are never equal in size. They differ from the Conchifera (called also *Lamelli-branchiata*), or ordinary bivalves, in uniformly having one side of the same valve symmetrical with the other. In technical language, the Brachiopoda are inequivalve and equilateral, while the True Bivalves are equivalve and inequilateral. The organization of the Brachiopoda is inferior to that of the True Bivalves. They are attached to bodies by a pedicle which passes as the wick does in an antique lamp, whence the older naturalists called them "Lamp-shells." The shell is lined by an expansion of the integument or mantle. They are very important in a geological point of view, existing from the Cambrian rocks till now; but culminating apparently both in generic and specific development in the Silurian. In 1875 above 1,800 fossil species were known, more than 900 of them British. In 1879 Dr. Alleyne Nicholson made a much higher estimate, considering that nearly 4,000 extinct species had been described. The recent species are comparatively few. They are all marine, occurring chiefly in the deep sea. The families are—(1) Terebratulidae, (2) Spiriferidae, (3) Rhynchonellidae, (4) Orthis, (5) Productidae, (6) Craniidae, (7) Discinidae, and (8) Lingulidae (q.v.). (Woodward & R. Tate.)

A slightly different classification ranges the Brachiopoda in two sub-classes—

- (1) *Inarticulata* or *Tretenterata*: Fam. (1) Craniidae, (2) Discinidae, (3) Lingulidae.
- (2) *Articulata*: Fam. (1) Terebratulidae, (2) Rhynchonellidae, (3) Theclidae, (4) Spiriferidae, (5) Pentameridae, (6) Strophomenidae, and (7) Productidae.

A. As substantive:

1. Originally: One of the Aryan conquerors of India who discharged priestly functions, whose ascendancy, however, over his fellows was intellectual and spiritual, but not yet political or supported by the caste system.

2. Now: One of the four leading castes of India, the others, theoretically at least, being *Kshatryas* (Warriors), *Vaisyas* (Merchants), and *Sūdras* (Labourers), not reckoning outcasts beyond the pale. [CASTE.] [For the rise of the Brahmana see BRAHMANISM.] The Brahmins in many places at present are about a tenth part of the community. They are the most intellectual of all castes, having great mental subtlety. They are admirably adapted for metaphysical speculation and for mathematical reasoning; but throughout their vast literature they have almost uniformly told monotonous myths in lieu of history. Nor do they care much for natural science. In these two respects they fall short of the average European mind. [BRAHMANISM.]

"... the language of the Brahmins."—Müller: *Hist. Ind. Ind. I.* 334.  
"The worshippers of Agni no longer form a distinct class, a few *Agnihotra Brahmanas*, who preserve the family, may be met with."—H. H. Wilson: *Religion of the Hindus*.

B. As adjective: In any way pertaining to a member of the caste described under A.

† *Brahmana beads*, *Brahman's beads*: A name given in India to the corrugated seeds of *Elaeocarpus*, used by the Brahmins and others as necklaces. They are sometimes worn as beads by children in East London, having been brought from India by seafaring relatives or friends.

**Brahman bull, Brahminy bull**, s. The Zebu, a variety of the *Bos taurus*, or Common Ox. It is distinguished by having a large fatty hump on its shoulders. Divine honours are paid to it in India, and it is deemed an act of piety to turn one loose in the streets, without any provision for its maintenance. It therefore helps itself from green-grocers' stalls or from gardens. It is not, as a rule, dangerous to pedestrians, but at times has warlike encounters with its humped com-

peers, besides systematically persecuting all cattle destitute of a hump. It is unpopular with those who are not of the Hindoo faith, but they dare not for their lives openly injure it, though the writer has heard of one being killed, suspicion falling on a European whose garden the divine beast had robbed.

**Brah-mān-ic, Brah-min-ic**, a. [From *Brahman*, *Brāhmin*, and suff. -ic. In Fr. *Brahmanique*.] Pertaining to Brahmins or to Brahmanism.

**Brah-man-ism, Brah-min-ism**, s. [From Eng. &c. *Brahman*, *Brāhmin*, and suff. -ism. In Ger. *Brahmanismus*; Fr. *Brahmanisme*.]

*Theol., Hist., & Phil.*: The system of religious belief and practice introduced and propagated by the Brahmins. This greatly varied with the lapse of ages, but to every successive form of it the name Brahmanism may be applied.

The earliest inhabitants of India seem to have been mainly Turanians. [TURANIAN.] When, at a very remote period of antiquity, these entered the peninsula, an Aryan nation or tribe existed in Central Asia, N. W. of India, speaking a language as yet unrecognised, which was the parent of nearly all the present European tongues, our own not excepted. At an unknown date a great part of this Aryan nation migrated to the north-west, and settled in Europe, the remainder taking the contrary direction, and entering India by the way of the Punjab. [ARYAN.] Admiring the glorious Eastern sky, they applied to it, and to the elements of nature, glowing adjectival epithets; these gradually became abstract substantives, then the qualities expressed were personified, and gods ruling over the several elements were recognised. Thus the sky was first called *Deva*, adj. = (1) bright, then (2) brightness, next (3) the Bright God; or, if the adjectival meaning be retained, Divine. This is the familiar Lat. *Deus* = God. Similarly *Dyaus* = the sky, is Gr. *Zeús* (*Zeus*), genit. *Διός* (*Dios*), from *Δις* (*Dis*), Latin *Dies pater* = Jupiter. Other divinities worshipped were, *Agni* = fire (Lat. *Ignis*), *Surya* = the sun, *Ushas* = the dawn [Gr. *ἠώς* (*ēōs*)], *Marut* = storm (Lat. *Mars*), *Prithivī* = the earth, *Ap* = the waters, *Nadī* = the rivers, *Varuna* = the sky [Gr. *οὐρανός* (*ouranos*)], *Mitra* = the sun, and *Indra* = the day. These gods are invoked in the 1,017 hymns of the *Rig-Veda*, the oldest Aryan book in the world.

Dr. Hang, of the Sanscrit College at Poonah, thinks the oldest of these may have been composed and uttered from 2400-2000 B.C., or at least from 2000 to 1400 B.C. Max Müller, the translator of the *Rig-Veda*, more moderately dates most of them between 1500 and 1200 B.C., believing the collection to have been finished about 1100 B.C. [RIG-VEDA, VEDA.] Whilst the Aryans were in the Punjab a religious schism took place amongst them, and a large number of them left India for Persia with feelings so bitter that what their former friends left behind called gods they transformed into demons. The venerable *Deva* = God, was changed into *dēva* = an evil spirit. Iran (Peria) was the place to which the seceders went, and there their faith developed into Zoroastrianism (q.v.). (See also *Zend-avesta*.)

The *Rig-Veda* was followed by three more, the *Yajur-veda*, the *Sāma-veda*, and the *Atharva-veda*, each with a Sanhita or collection written in poetry, and Brahmanas and Sūtras, prose compositions; but these are not so valuable as the *Rig-Veda* for tracing the old beliefs.

From about 1000 to 800 B.C. collections were being made of the old sacred literature. From about 800 to 600 B.C. the Brahmanas were composed (Dr. Hang thinks between 1400 and 1200 B.C.). Then the Sūtras (exegetical compositions), which follow, make Brahmanas as well as Mantras divine.

The exact date of the two great epic poems—the Ramayana and the Mahabharat—is unknown; but the former is believed to be the older. By the time that it appeared the constellation of Vedic gods had set, and one of

deified heroes was arising or had arisen. Rama, the deified King of Ayodhya (Oude), the hero of the former poem, is still extensively worshipped, along with his friend and follower, Hanuocan, the monkey god. So is Krishna, the hero of the Mahabharat.

During the period of the Brahmanas, the Brahmanic priesthood had risen to great power; during that of the Sūtras they were in quiet enjoyment of their caste dignity. By the sixth century Booddha had arisen to preach the equality of all castes, and his system was dominant in India from about 250 B.C. till 750 A.D., that is, for a thousand years. [BOODDHISM.]

When Brahmanism reasserts its sway the Hindoo triad of gods—Brahma, Vishnu, and Shiva—have arisen (see these words). Nay, Brahma has become almost obsolete, and the respective advocates of Vishnu and Shiva are at variance. Between the twelfth and the sixteenth centuries monastic reformers formed sects, some Vishnuvite, others Shaivite. New sacred books, called, however, Puranas (meaning old), are penned to advocate the tenets of conflicting sects, and, though contradicting each other, are accepted as divine. The Mohammedan invasion somewhat repressed their quarrels. [PURANAS.] At present, the worship of Vishnu under the forms of Krishna and of Rama, and of Shiva under that of the Lingam; with the veneration of Sakti, the power and energy of the divine nature in action; to which must be added the adoration of Hanuocan, Rama's friend; and in many places of aboriginal Turanian gods, are the most prevalent forms of popular Hinduism. Reformers are falling back on the Vedas, and Christianity obtains converts from it in every part of the land.

A. As substantive :

I. Ordinary Language :

1. Literally : The soft mass contained within  
the cavity of the skull, the encephalon. [II.,  
1.]

"Proceeding from the best-oppressed brain."  
Shakesp.: Meach. ii. 1.

(1) In this sense it may be used in the plural,  
when the brains of different individuals,  
human or animal, are compared to each  
other.

" . . . at no period of life do their brains perfectly  
agree."—Darwin: Descent of Man, vol. 4. (1871), pt. 1,  
ch. 1, p. 3.

(2) When only one individual is referred to.

"Voices were heard threatening, some that his  
brains should be blown out . . ."—Macaulay: Hist.  
Eng. ch. xii.

2. Figuratively : The intellect.

" . . . the brain devise laws . . ."  
Shakesp.: Mer. of Ven., I. 2

¶ In this sense used also in the plural.

" . . . to beat this from his brains,"  
Shakesp.: Hen. VIII., iii. 5.

¶ To cudgel the brains : To stimulate the  
faculty of attention, with the view of solving an  
intellectual difficulty which could not be  
satisfactorily disposed of in one's ordinary  
listless mental state.

II. Technically :

1. Anat. : That part of the nervous system  
contained within the cranium, or encephalon,  
the central part of the nervous system, com-  
posed of the cerebrum, cerebellum, and me-  
dulla oblongata (q.v.). It is formed by the  
continuity of the fibres of the spinal cord  
upwards to the cephalic centres.

¶ (1) Compar. Anat. : The centre of the  
nervous system in the lowest of the animals  
which possess a brain is in the form of a  
double cord ; a step higher, and knots or  
*ganglia* are developed on one extremity of the  
cord. Such is the rudimentary structure of  
brain in the lowest vertebrata. In the lowest  
fishes the anterior extremity of the double  
cord shows a succession of five pairs of  
*ganglia* ; in the higher fishes and amphibia  
the first two become fused into a single  
*ganglion* ; then follow only three pairs of  
symmetrical *ganglia*. This carries us up in the  
animal scale to mammals (q.v.) ; for instance,  
in the dog and cat we find a single *ganglion*,  
cerebellum, then three pairs following each

fäte, fät, färe, amidst, whät, fäll, father ; wë, wët, hère, camel, hër, thère ; pine, pít, sire, sir, marine ; gö, pöt,  
or, wöre, wöf, wörk, whö, sön ; müte, cüb, cüre, uníte, cür, rüle, füll ; trý, Sýrian. æ, œ = é. ey = ä. qu = kw.

other, and the primitive ganglia of opposite sides, at first separate, become united by means of transverse fibres, commissures (commissura = a joining), for associating in function the two symmetrical portions. Hence the deduction that the brain in the lower animals consists of primitive cords, primitive ganglia upon these cords, and commissures which connect the substance of adjoining ganglia and associate their functions.

(2) Human Anatomy:

(a) In the fetus: In the human fetus, the earliest sign of the spinal cord is a pair of minute longitudinal filaments side by side; on the anterior extremity of these five pairs of minute swellings are seen, not in a straight line, as in fishes, but curved on each other to correspond with the future cranium. The posterior pair soon become cemented on the middle line, forming one; the second pair also unite; the third and fourth, at first distinct, are soon veiled by a lateral development arching backwards to conceal them; and the anterior pair, at first small, become less and almost lost in the development of the other pairs; so that the architecture of the human brain is the same as that of the lower animals, but progressive. [ARCHENCEPHALA.]

(b) In the adult: In the adult the primitive cords, described under 2 (a), have become the spinal cord, at the upper extremity they separate under the name of crura cerebri; the first pair of ganglia, developed from the primitive cords, have become the cerebellum; the second pair (the optic lobes of animals) become the corpora quadrigemina of man; the third pair, the optic thalami, and the fourth, the corpora striata, are the basis of the hemispheres, which, the merest lamina in the fish, have become the largest portion, the cerebrum, of the brain in man; the fifth pair (olfactory lobes), so large in the lowest forms, dwindle into the olfactory bulbs of man. The brain is composed of fibres or fasciculi ranged in some parts longitudinally, in others interlaced at various angles by cross fibres, and connected and held together by a delicate areolar web, which is the bond of support of the entire organ. It is enveloped by three lining membranes, the dura mater, the arachnoid, and the pia mater (q.v.). The brain substance is of two kinds, differing in density and color, a grey or cineritious or cortical substance, and a white or medullary substance. The grey substance forms a thin lamella over the entire surface of the convolutions of the cerebrum, and of the laminae of the cerebellum, hence it has been named cortical; but it is likewise found in the centre of the spinal cord through its entire length, thence through the medulla oblongata, crura cerebri, thalami optici, and corpora striata; also in the locus perforatus, tuber cinereum, commissura mollis, pineal gland, pituitary gland, and corpora rhomboidea. As clearly shown by Dr. Sieveking, there is a peculiar property in the white matter of the brain, namely, the great elasticity of the medullary substance, and the resiliency afforded by this is the counterpoise of the rigid structures enveloping the brain, and which do not, as erroneously supposed, remove it entirely from the influence of atmospheric pressure.

The microscopic elements of the brain are white nerve-fibres from 1/1000 to 1/10000 of an inch in diameter; grey nerve-fibres, one-half or one-third less than the white in diameter (Hewle); nerve-cells, between 1/100 and 1/1000 of an inch in diameter; and nerve-granules, between 1/1000 and 1/10000 of an inch in diameter, with a variable number of pigment-granules. The division of nerves into cranial and spinal is purely arbitrary, for with respect to origin, all but the first (the olfactory) proceed from the spinal cord or its immediate prolongation into the brain.

The weight of the human brain, according to Scemmering, is 2 lbs. 5 1/2 oz. to 3 lbs. 1 oz. 7 drs.; Dr. Aitken says from 80 to 92 ounces, with a bulk of from 65 to 84 cubic inches. Dr. John Reid states that there is an average difference of 5 oz. 11 drs. in favor of the male brain. According to Scemmering, the largest brain of a horse is 1 lb. 7 oz.; that of an elephant dissected by Sir Astley Cooper had a weight of 8 lbs. 1 oz.; and Rudolphi found that of a common whale (Balæna mysticetus), 75 feet long, to weigh 5 lbs. 10 oz.

The average sp. gr. of healthy brain is 1.036; mean of grey matter, 1.034; of white, 1.041. Its blood supply is derived through the pia-mater membrane.

2. Chem.: The chemical constituents of the brain are albumen; fatty matter, including two acid compounds containing a large amount of phosphorus, from eight to ten parts in 1,000, or one-twentieth to one-thirtieth of the whole solid matter; also salts, and from four-fifths to seven-eighths of water.

3. Physiol.: The organ for manifestation of the intellectual faculties, such as the emotions, the passions, and volition, and also of sensation. The evolution of nerve-force connected with mind emanates directly from the hemispherical ganglia. The spinal cord, by its connection with the brain, is the essence of combined movements. The brain alone furnishes conditions necessary for intelligence; the spinal cord for movement; and together they connect the balancing and co-ordination of motor and sensitive power.

4. Path.: The chief diseases of the brain are—abscess of the organ, aphasia (in which the anterior lobes are affected, with difficulty of expressing thought), apoplexy (q.v.), brain fever, cancer, concussion and compression, epilepsy, hydrocephalus, hysteria, headache, induration, insanity, paralysis, softening, sunstroke and tumors (q.v.).

B. As adjective: Relating to the brain in any of the foregoing senses. (See the compounds which follow.)

2. The English name of *Pteris*, a genus of ferns belonging to the order Polypodiaceae. [PRENIS.] It is so called from growing abundantly in such brakes as those described under No. 1. The common brake, called, more especially in Scotland, the bracken, is very abundant in woods and on heaths, and constitutes quite a feature of the scenery in such localities. It is the commonest British fern. It is very abundant in Epping Forest, and is the only fern that is common there. If an excursionist allow himself to be benighted in the forest it will aid him in picking his steps to know that wherever the brake or bracken grows the spot is presumably dry, wherever it is absent the place is presumably marshy. It is an excellent covert for game, and where deer exist they love to be among it. The country people believe that, taken medicinally, it will destroy worms, and that to lie upon it will cure the rickets in children. Its leaves are used for thatching cottages. Its astringent quality has led to its employment for dressing and preparing chamols leather, and the ashes are useful in the manufacture of soap and glass. It is sometimes spelled also *brakes*.

At thorns, and brakes, and brambles—and in truth,

\* **Bra-mā** (2), *s.* [BRAHMA.]

**Bra-mah**, *s. & a.* [From Mr. Joseph Bramah, who was born at Stainborough, in Yorkshire, on April 13, 1749, and died December 9, 1814. See A.]

A. *As subst.*: Mr. Bramah, who invented the Bramah-lock, the Bramah-press, &c.

B. *As adj.*: Invented by Mr. Bramah.

**Bramah-lock**, *s.* A lock patented by Bramah, in England (1784 and 1798), having a number of slides which are adjusted in the manner of tumblers, by means of a stepped key, so that the slides of unequal length shall be brought into a position where their notches lie in the same plane, that of the locking-plate. [LOCK.]

**Bramah-press**, *s.* A machine designed to turn to account Pascal's Law [LAW] of the equality of pressure in a mass of liquid, by using water under pressure to produce a mighty force. It was patented by Mr. Bramah in 1796. It is called also the Hydraulic or Hydrostatic Press. It consists essentially of a large, very strong cylinder, in the collar of which a cast-iron piston or ram works water-tight. Above the ram is a movable cast-iron plate, and at some distance higher than it a fixed one, both being kept in their places by four strong columns. The portion of the cylinder beneath the ram is full of water, and is connected by a pipe with a small forcing pump. When the latter is put to action it compresses the water in it, and that pressure transmitted by the pipe to the large cylinder in which the ram works, acts equally on every part of it [PASCAL'S-LAW], with the practical effect of eorizontally increasing the original force. Thus, if the diameter of the piston in the forcing-pump is an inch, and that of the ram in the cylinder four feet, then the pressure on the latter is (12 x 4)<sup>2</sup> = 2,304 times greater than that exerted by the former. Goods to be pressed—bales for cloth, for instance, or beet-roots, are placed on the lower or movable plate, and are forced up against the fixed one. The portions of the Menai tubular bridge were raised to their positions by means of a powerful Bramah-press.

The former passage shows that it was little regarded, the latter that it was thorny and used as fuel. *Atad* is supposed to be the same as Arab. *ausuj* = a kind of buckthorn, and is probably a rhamnaceous plant, *Zizyphus spina Christi*, because it is thought that from it was made the crown of thorns, which for purposes of insult and torture was placed around the sacred forehead of Christ immediately before his crucifixion (*John* xix. 2, 5).

1. *Lit.*: The skins or husks of ground corn, especially wheat, separated from the flour. The nutritive value of these husks increases as we proceed from the outside of the grain toward the interior. The outer skin, or coarse bran, is very indigestible, owing to the presence of a layer of silica. The inner skins, called pollards, are more nutritious, containing from 12 to 15 per cent. of nitrogenous matter, and from 20 to 30 per cent. of starch. Unless, however, they are ground very finely, they are apt to set up irritation of the bowels and diarrhæa. Though rich in nitrogeen, bran appears to possess but little nutritive power. It may be of use to those who are well fed, and need a laxative, but to the poor who need nourishment it is of very little use. It is, however, of some commercial value, being largely employed in the feeding of horses and cattle, and in brightening goods during the processes of dyeing and calico-printing.

The first part is from Sw. *branna*; Dan. *brände*; Dut. *branden*, all = to burn, to distil. Sw. *brand* = brand, fire-brand; Dan., Ger., & Dut. *brand* = fire, burning, conflagration. [BRAND, *v.* & *s.*] The second part is from Fr. & Sw. *vin*; Dan. *vin*; Ger. *wein*; Dut. *wijn*.] [WINE.]

**A. As substantive**:

1. *Formerly*. (Of the forms *brandywine* and *brandywine*, etymologically meaning burnt or disilled-wine.) [BRANDY-WINE.]

2. *Now*. (Of the form *brandy*, being the adjective in the foregoing compound discovered from its associate *wine*, and made to stand alone as a substantive.) A spirit produced by the distillation of both white and red wines, prepared chiefly in the south of France. The brandy most esteemed in our land is that of Cognac, which is obtained by distilling white wines of the finest quality. An inferior kind of spirit is frequently prepared from the "marc" of grapes and the refuse of wine vats. When first distilled it is as colourless as alcohol, and continues so if kept in bottles or jars. When stored in casks, however, it acquires from the wood a pale amber tint, and in this state is sold as pale brandy. The dark colour of brown brandy is produced artificially, to please the public taste, by means of a solution of caramel, and this is frequently added in excess to give a rich appearance to a brandy of low quality. A large proportion of the brandy sold in this country is simply raw grain spirits flavoured and coloured. The spirit is exported from England and Germany into France, where it is redistilled and converted into French brandy. Brandy improves in flavour by being kept, but loses in strength. Genuine brandy consists of alcohol and water, with small quantities of æthanitic ether, acetic ether, and other volatile bodies produced in the process of fermentation. The value of brandy as a medicine depends on the presence of these ethers and other volatile products; when, therefore, it is adulterated with raw grain spirit and water, the amount of these ethers is so reduced that the brandy becomes almost valueless for medical purposes. In the United States brandy is made from cherries, apples, pears and peaches, while much common whisky is exported to France, from which, after manipulation, it is returned as brandy. A more legitimate manufacture of brandy goes on in California, where large quantities of pure wine brandy are annually produced and distributed through the States. The strength of brandy as sold varies from proof to 30 or even 40 under proof. Imitation brandy is prepared by flavouring highly-rectified spirit with essence of Cognac, or by distilling it with bruised prunes, acetic ether, argol, and a little genuine brandy. This is said to be greatly improved by keeping.

2:3

brasa = to flame; Dan. brasa = to fry; possibly connected with Sanac. bhraij = to fry. According to Dr. Murray there is no evidence of any connection between the two.]

A. As substantive:

I. Ordinary Language:

1. Literally:

(1) The yellow-colored compound metal, consisting of an alloy of copper and zinc, described under II. 1.

(2) Any article made of brass, a brass fitting. (Generally in the plural.)

"This very scullion who cleans the brasses."—Hopkinson. (Goodrich & Porter.)

(3) A monumental brass. [II. 8.]

"If not by them on monumental brass." Thomson; v.

(4) Musical instruments of brass, as distinct from those of wood. [BRASS-BAND, 1 (2) (3).]

(5) Money, both in Old English and in modern slang, on account of the use of the metal in the coinage. [TIM, COPPER.]

"And here here brass at the bakke, to enlay to sell."—Piers Plow. 5. Vii. l. 116.

2. Figuratively: Hardness, the typical quality of the metal. It is frequently in the Bible mentioned along with iron in a similar sense, as in the following cases—

(1) Strength for defence or attack.

"I will make thine horn iron, and I will make thy hoofs brass; and thou shalt beat in pieces many people."—Micah iv. 13.

(2) Obstinacy in wickedness.

"They are all grievous revolters, walking with slanders: they are brass and iron; they are all corrupters."—Jer. xl. 26.

(3) Effrontery, impudence, shamelessness; incapability, like that of brass, either to yield or to change colour in circumstances where an ordinary being composed of flesh and blood would do so.

"Because I knew that thou art obstinate, and thy neck is as iron sinew, and thy brow brass."—Isa. xlviii. 4.

"... his forehead of brass and his tongue of venom."—Macaulay: Hist. Eng., ch. iv.

II. Technically:

1. Metal: An alloy of copper and zinc.

(1) In ancient times: It is said that when the Roman consul Mummius, after capturing the celebrated Grecian city of Corinth, barbarously burnt the place to the ground, in B.C. 146, various metals, fused in the configuration, became united into a compound or alloy, called from the circumstances now stated Corinthian brass. This is often supposed to have been the first discovery of brass itself, but Assyriologists consider it to have been mentioned in cuneiform inscriptions, both Chaldean and Assyrian. (See an elaborate dissertation on the subject by Francis Lenormant, in the Bib. Arch. Soc. Transact., vol. vi, 1878, 334-417.) [2.]

(2) In modern times: Before zinc was obtained in its metallic form brass was manufactured from calamine (native carbonate of zinc) mixed with copper and charcoal. Even now this process is easier than the direct fusion together of the two metals. The proportion of copper and zinc vary. Ordinary brass is a yellow alloy of copper and twenty-eight to thirty-four per cent. of zinc. The density of cast brass is 7.8 to 8.4; that of brass wire 8.54. It is harder and yet more fusible than copper, more sonorous and a worse conductor of heat. It may be turned upon a lathe. It is extensively used for candlesticks, handles of doors, the framework of locks, mathematical instruments, &c., while in the state of wire it is much used in pin-making. [DUTCH GOLD.]

2. Scripture: The Heb. word for "brass" is נַחְשׁוֹן (nachashon), from נָחַשׁ (nachash) = to shine. The metal thus designated evidently occurs in nature, for it is dug out of hills (Deut. viii. 9) and "molten out of the stone" (Deut. xxiii. 25), which the artificial alloy, brass, never yet has been. In most parts of the Old Testament "brass" should be altered into "copper," though occasionally in the later books of the Old Testament it may be bronze. In the New Testament, in 1 Cor. xiii. 1, and Rev. ix. 20, the rendering is χαλκός (chalkos) = (1) copper, (2) bronze; whilst in Rev. i. and ii. it is χαλκοβιβανός (chalkobibanos), probably = frankincense of a deep colour.

3. Arch. (pl.): Monumental engravings on brass plates let into slabs in the pavements of ancient churches, representing the effigies,

coats of arms, &c., of illustrious personages. (Gloss. of Arch.)

4. Mach.: A pillow, bearing, collar, box, or bush supporting a gudgeon. The name is applied from its being sometimes of brass, though in various instances it is of bronze.

5. Mining: Iron pyrites. The name, which is a misnomer, is given from the lustre, which resembles that of brass.

B. As adjective: Consisting more or less of brass; brazen, resembling brass, in any way pertaining or relating to brass.

¶ Compounds of obvious signification: brass-bound (Carlyle; Sartor Resartus, bk. ii., ch. v.); brass-hoofed (Pope: Homer's Iliad, xl. 19); brass-paved (Spenser: F. Q., I. iv. 17); brass-studded (Longfellow: Courtship of Miles Standish, iv.); brass-throated (Longfellow: The Spanish Student, li. 1); brass-visaged (Ben Jonson: Every Man out of his Humour).

brass-band, s.

I. Literally:

(1) Gen.: A band of musicians performing upon instruments of brass.

(2) Spec.:

(a) The smaller variety of the military band, employed chiefly in cavalry regiments, on account of the greater ease with which brass instruments can be played on horseback. Those used are various: cornets, saxhorns, euphoniums, one or more bombardons, &c. (Croce.)

(b) One of the divisions of the "wind" of a full orchestra, consisting of trumpets, horns, trombones, and occasionally an ophicleide. [BAND.]

2. Figuratively. In political controversy, contemptuously: A party or a section of a party acting noisily in concert. Some years ago extreme Protestant controversialists denominated a knot of Roman Catholic members of Parliament voting together "the Pope's brass band."

brass-foil, s. Very thin beaten sheet-brass, thinner than latten. It is called also Dutch gold.

brass-furnace, s. A furnace for fusing the metallic constituents of brass. These are melted in crucibles, the copper being first melted, and the zinc then added piecemeal, as it is vapourised by an excess of heat. The moulding-trough is on one side of the pouring or spill-trough, and the furnace is on the other. There is a core-oven, heated by the furnace, and serving to dry the cores for the faucets or other hollow articles which are cast. (Knight.)

brass-powder, s. A powder made of brass, or anything resembling it. Two kinds are made.

1. Red-coloured: Ground copper filings or precipitated powder of copper with red ochre.

2. Gold-coloured: Gold-coloured brass or Dutch leaf reduced to powder.

¶ They are mixed with pale varnish, or else they can be applied by dusting over a surface which has been previously covered with varnish. (Knight.)

Bot.: A genus of cruciferous plants containing several well-known culinary herbs. There are three wild species in Europe: Brassica oleracea (Sea Cabbage), the original of the cabbage of our gardens [CABBAGE]; B. oleracea, the Isle of Man or Wall-flower Cabbage; and the B. campestris or Common Wild Nettle. The B. napus, the Rape or Cole-seed, and the B. rapa, or Common Turnip, have here and there rooted themselves spontaneously, but they are not indigenous. The colza of the Dutch is B. campestris; B. praecox is the Summer Rape of the Germans; and B. elongata is cultivated in Hungary for its oil. Crabb thus distinguishes between the verbs to *brave*, to *defy*, to *dare*, and to *challenge*:—"We *brave* things; we *dare* and *challenge* persons; we *defy* persons or their actions: the sailor *braves* the tempestuous ocean, and very often *braves* death itself in its most terrific form; he *dares* the enemy whom he meets to the engagement; he *defies* all his boasts and vaunts and threats. . . . *Brave* and *defy* are dispositions of mind which display themselves in the conduct; *dare* and *challenge* are modes of action; we *brave* a storm by meeting its violence, and bearing it down with superior force; we *defy* the malice of our enemies by pursuing that line of conduct which is most calculated to increase its bitterness. To *brave* conveys the idea of a direct and personal application of force to force; *defying* is carried on by a more indirect and circuitous mode of procedure: men *brave* the dangers which threaten them with evil; they *defy* the angry will which is set up to do them harm. To *dare* and *challenge* are both direct and personal; but the former consists either of actions, words, or looks; the latter of words only. . . . *Daring* arises from our contempt of others; *challenging* arises from a high opinion of ourselves: the former is mostly accompanied with unbecoming expressions of disrespect as well as aggravation; the latter is mostly divested of all angry personality. . . . We *dare* only to acts of violence; we *challenge* to any kind of contest in which the skill or the power of the parties are to be tried." (Crabb: *Eng. Synon.*)

† bráve-ness, s. [Eng. brave; -ness.] The quality of being brave; bravery.

brá-v-ér-ý, brá-v-ér-ic, a. [Eng. brave; -ry. Fr. bravérie.]

I. Literally:

1. In a good sense: The quality of being brave; courage, valour, high spirit, fearlessness.  
"Juba, to all the bravery of a hero,  
Add'd softest love, and more than female sweetness."  
Addison.

2. In a bad sense:

(1) The act of braving, bravado; false assumption of real bravery.  
"In which time one Tait, a follower of Cestrod, who as then was of the Lord's party, came forth in a bravery, and called to the opposite horsemen, asking if any of them had courage to break a lance for his mistress: . . ."  
—Spotswood, p. 257.

"Some of his soldiers, however, who observed him closely, whispered that all his bravery was put on."  
—Macaulay: *Hist. Eng.*, ch. xviii.

(2) Showiness, gaudiness, splendour.

II. Fig.: Applied to fine diction or ornate language.

"In the present cause, we must not be pleased or put off with the husky or bravery of language.—Clothed and adorned with the hawk and bravery of beautiful and big words."—M<sup>r</sup> Ward: *Contending*, pp. 234, 235.

Crabb thus distinguishes between *bravery*, *courage*, and *valour*:—"Bravery lies in the blood; *courage* lies in the mind: the latter depends on the reason; the former on the physical temperament: the first is a species of instinct; the second is a virtue: a man is *brave* in proportion as he is without thought; he has *courage* in proportion as he reasons or reflects. *Bravery* seems to be something involuntary, a mechanical movement that does not depend on one's self. *Courage* requires conviction, and gathers strength by delay; it is a noble and lofty sentiment: the force of example, the charms of music, the fury and tumult of battle, the desperation of the conflict, will make cowards *brave*; the *courageous* man wants no other incentives than what his own mind suggests. . . . It is as possible for a man to have *courage* without *bravery* as to have *bravery* without *courage*: Cicero betrayed his want of *bravery* when he sought to shelter himself against the attacks of Cataline; he displayed his *courage* when he laid open the treasonable purposes of this conspirator to the whole senate, and charged him to his face with the crimes of which he knew him to be guilty. *Valour* is a higher quality than either *bravery* or *courage*, and seems to partake of the grand characteristics of both; it combines the fire of *bravery* with the determination and firmness of *courage*: *bravery* is most fitted for the soldier and all who receive orders; *courage* is most adapted for the general and all who give commands; *valour* for the leader and framer of enterprises, and all who carry great projects into execution: *bravery* requires to be guided; *courage* is equally fitted to command or obey; *valour* directs and executes. *Bravery* has most relation to danger; *courage* and *valour* include in them a particular reference to action: the *brave* man exposes himself; the *courageous* man advances to the scene of action which is before him; the *valiant* man seeks for occasions to act. The three hundred Spartans who defended Thermopylae were *brave*. Socrates drinking the hemlock, Regulus returning to Carthage, Titus tearing himself from the arms of the weeping Berenice, Alfred the Great going into the camp of the Danes, were *courageous*. Hercules destroying monsters, Perseus delivering Andromeda, Achilles running to the ramparts of Troy, and the knights of more modern date who have gone in quest of extraordinary adventures, are all entitled to the peculiar appellation of *valiant*." (Crabb: *Eng. Synon.*)

A. As substantive:

1. A disease in sheep. This term is frequently applied to totally different disorders, but the true braxy is undoubtedly an intestinal affection, attended with diarrhoea and retention of the urine. After young sheep have been weaned, they are apt to gorge themselves with grass, turnips, &c.; this produces a kind of colic, which usually ends in death. Again, when a lean flock of sheep is placed suddenly on rich food, or on coarse pasture of an indigestible nature, irritation and inflammation of the bowels set in, and this frequently proves fatal. In both cases the sheep are said to die of braxy. The duration of the disease is very short, in some cases terminating fatally in twenty-four hours. Hilly land is favourable to the production of braxy, and hence we find it far more prevalent in the

Highlands of Scotland than in any other part of the country. The treatment of the disease is one of very great difficulty, but it may to a certain extent be prevented by regulating the animal's diet, and sheltering the flock during severe winter weather.

3. The mention of such a sheep.

**B. As adjective:** Of or belonging to a sheep which has died of braxy.

¶ **Braxy-mutton:** The flesh of a sheep which has died of braxy. As the duration of the disease is very short, it may be assumed that the structures of the body have not been affected by it, and that the disease has been limited to the intestines. Every part of the sheep therefore is eaten, except the liver, the kidneys, and the intestines. As to its being wholesome food, Mr. J. Willison, one of the largest sheep-farmers in Scotland, who has had seventy years' experience, says, "In flavour braxy resembles grouse or black-game more than any food I have ever tasted. It is wholesome and very digestible, and in my long experience I have never known of any man, woman, or child having any disease or disorder of the human system from eating braxy. It should, however, be well cooked."

II. Scripture & Theology: In the earlier part of the Old Testament, brazen, in the authorised version, means made of copper; in some of the later parts it may mean made of bronze. Nowhere, apparently, in the Old Testament does it signify made of what we now call "brass." [Brass.] Connected with the Jewish tabernacle and the worship there offered there were "brazen" (or copper) vessels and utensils, as "brazen censers (Num. xvi. 39), pots (Lev. vi. 28), a "grate of network" (Exod. xxvii. 4, xxxv. 16, xxxviii. 4), rings (ibid. xxvii. 4), a laver (ibid. xxx. 18). Jewish History and Theology: A serpent of "brass" (copper), placed upon a pole and elevated in the sight of the Jewish people in the wilderness, that those bitten by fiery serpents looking at it in faith might be cured. (Num. xx. 9.) Jesus draws a parallel between the lifting up of the serpent (upon a pole) and his own lifting up (upon the cross), as the object of faith for the attainment of eternal life. (John iii. 14, 15.)

† *Crabb* thus distinguishes between *breach*, *break*, *gap*, and *chasm*: "The idea of an opening is common to these terms, but they differ in the nature of the opening. A *breach* and a *gap* are the consequence of a violent removal, which destroys the connection; a *break* and a *chasm* may arise from the absence of that which would form a connection. A *breach* in a wall is made by means of cannon; *gaps* in fences are commonly the effect of some violent effort to pass through; a *break* is made in a page of printing by leaving off in the middle of a line; a *chasm* is left in writing when any words in the sentence are omitted. A *breach* and a *chasm* always imply a larger opening than a *break* or *gap*. A *gap* may be made in a knife; a *breach* is always made in the walls of a building or fortification: the clouds sometimes separate so as to leave small *breaks*; the ground is sometimes so convulsed by earthquakes as to leave frightful *chasms*. *Breach* and *chasm* are used morally; *break* and *gap* seldom otherwise than in application to natural objects." **II. Technically:**

1. *Baking*: Loaves or cakes made from the flour of wheat, rye, or some other grain, and baked.

(1) *Hist.*: The art of baking bread is very ancient. It was known to the Egyptians, the Hebrews, the Greeks, the Romans, and other nations. In England, bread was made with yeast in 1634. Machinery was used in its production in 1858. Aerated bread was made in 1859, having been in use some years earlier in the United States.

(2) *Modern process of manufacture*: There are two kinds of bread, leavened and unleavened. Leavened, or fermented bread, is prepared by mixing together certain quantities of flour, warm water, salt and yeast, or *leaven*. After the lapse of some time fermentation sets in, and the dough, or sponge as it is called, becomes permeated with carbonic acid gas, a small quantity of alcohol being also formed. As soon as the mass is in a briak state of fermentation, fresh portions of flour and water are added, and the whole thoroughly mixed or kneaded. The dough is next cut and shaped

into loaves, and these, after being left for about two hours, during which they swell to nearly double their size, are then ready for the oven. The heat of the oven checks the fermentation, and expels all the alcohol, and most of the carbonic acid gas.

The art of bread-making consists in producing a light, porous crumb, and a pale-colored crust. The crumb should consist of dextrine, starch, gluten, and from 35 to 40 per cent. of water. The crust should consist almost entirely of dextrine.

Leaven, which is now seldom used in this country, is a mixture of flour, potatoes, and water, kept in a warm place till it begins to ferment.

Unleavened, or unfermented bread, is of two kinds. In the one, flour and water only are used, and this produces a heavy and compact bread. In the other, an acid and a carbonate are added for the purpose of disengaging carbonic acid gas, which, in imitation of yeast, raises the dough and renders the bread light and porous. The substances used are carbonate of ammonia or carbonate of soda, in combination with hydrochloric or tartaric acids. None of these ingredients are deleterious; but by far the best is carbonate of ammonia, as it is entirely driven off in the oven.

Aerated bread is prepared by forcing pure carbonic acid gas into the dough contained in a strong iron vessel. When this carbonated dough is introduced into the oven the gas expands and escapes, leaving the bread light and porous. Brown bread is ordinary white bread with from 15 to 20 per cent. of fine bran.

Whole meal bread, made from unsifted ground wheat, is the only true brown bread, being richer in nutritious matter in white bread. The amount of nitrogenous matter in white bread varies from 5 to 8 per cent., whilst in whole meal bread it rises to 14 per cent.

The adulteration of bread is carried on to a large extent, more especially in London. The quality of a loaf is very frequently judged by its whiteness; when, therefore, an unscrupulous baker has used an inferior or damaged flour, he finds that by adding alum or sulphate of copper, he is able to produce a loaf equal in whiteness to one made from the finest flour. These two substances are, however, dangerous adulterants. They not only render the bread indigestible, but when taken into the system for any length of time, are apt to disorder the stomach and produce various diseases. It should also be remembered that sulphate of copper is a poison.

Bolled rice, beans, and potatoes are also frequently used to adulterate bread. They are harmless in themselves, but are added for cheapness, and to increase the weight of the loaf, these substances retaining more water than wheat flour. In a recent experiment, it was proved that when half-a-pound of rice flour was substituted for half-a-pound of wheat flour in a two-pound loaf, the loaf was found to contain five per cent. more moisture than that found in a loaf made from pure wheat flour. [**SHIP-BREAD, CASSAVA-BREAD.**]

¶ (a) Crabb thus distinguishes between to break, to rack, to rend, and to tear:—"The forcible division of any substance is the common characteristic of these terms. Break is the generic term, the rest specific; every thing raked, rent, or torn is broken, but not vice versa. Break has, however, a specific meaning, in which it is comparable with the others. Breaking requires less violence than either of the others: brittle things may be broken with the slightest touch, but nothing can be raked without intentional violence of an extraordinary kind. Glass is quickly broken; a table is raked. Hard substances only are broken or raked; but everything of a soft texture and composition may be rent or torn. Breaking is performed by means of a blow; racking by that of a violent concussion; but rending and tearing are the consequences of a pull."

(b) To break, to bruise, to squeeze, to pound, and to crush are thus discriminated:—"Break always implies the separation of the component parts of a body; bruise denotes simply the destroying the continuity of the parts. Hard, brittle substances, as glass, are broken; soft, pulpy substances, as flesh or fruits, are bruised. The operation of bruising is performed either by a violent blow or by pressure; that of squeezing by compression only. Metals, particularly lead and silver, may be bruised; fruits may be either bruised or squeezed. In this latter sense bruise applies to the harder substances, or indicates a violent compression; squeeze is used for soft substances or a gentle compression. The kernels of nuts are bruised; oranges and apples are squeezed. To pound is properly to bruise in a mortar so as to produce a separation of parts; to crush is the most violent and destructive of all operations, which amounts to the total dispersion of all the parts of a body. What is broken may be made whole again; what is

bruised or squeezed may be restored to its former tone and consistency; what is pounded is only reduced to smaller parts for convenience; but what is crushed is destroyed."

(c) The following is the distinction between to break, to burst, to crack, and to split:—"Break denotes a forcible separation of the constituent parts of a body. Burst and crack are onomatopœias, or imitations of the sounds which are made in bursting and cracking. Splitting is a species of cracking that takes place in some bodies in a similar manner without being accompanied with the noise. Breaking is generally the consequence of some external violence; everything that is exposed to violence may without distinction be broken. Bursting arises mostly from an extreme tension; hollow bodies, when over filled, burst. Cracking is caused by the application of excessive heat, or the defective texture of the substance: glass cracks; the earth cracks; leather cracks. Splitting may arise from a combination of external and internal causes; wood in particular is liable to split. A thing may be broken in any shape, form, and degree; bursting leaves a wide gap; cracking and splitting leave a long aperture; the latter of which is commonly wider than that of the former." (*Crabb: Eng. Synon.*)

1. *Physiol.*: For details regarding the organic machine on the action of which breathing depends, see LUNGS. For the process of breathing itself see RESPIRATION. From 350 to 400 cubic feet of air are drawn into the lungs in 24 hours. The air expired is different, both in volume and composition, from that which was respired. Each hour an adult man takes in 450 to 550 grains of oxygen, and emits in the same period about 632 grains of carbonic acid, about 45 to 50 grains of nitrogen, and 9,720 grains of watery vapour. Hence a continued supply of fresh air, laden with oxygen, is needful to maintain life. For the want of it, out of 146 prisoners shut up to the "Black Hole" of Calcutta, which was not a hole at all but only a room too small for its occupants, 123 perished in eight hours, as did 260 out of 300 Russian prisoners confined in a cave after the battle of Austerlitz. In small arms the barrels may be hinged, or the breech may be opened and closed by means of a movable block of metal; in artillery the breech is closed by a screw or a wedge. The use of breech-loaders goes back to the sixteenth century; indeed, it is probable that that form of arm is about as old as the muzzle-loader. In the modern form, however, it is of quite recent introduction. The Prussian needle-gun, which dates from about 1840, was the first breech-loading rifle used as a military weapon. The soldiers of all European armies now use breech-loaders. [MAGAZINE-RIFLE.]

It is graduated to degrees and fractions, their length on the scale being equal to the tangents of an arc having a radius equal to the distance between the front and rear sights. The front sight is merely a short piece of metal screwed into the gun, usually at the muzzle, but sometimes between the trunnions, or on one of the rimbases, with its upper edge parallel to the bore of the gun. The rear sight may be detached, having a circular base fitting the base of the gun, or may slide through a slotted lug, and be retained at any given height by a set screw. The breech-sight, the tangent scale, and the pendulum are merely different forms of this device. (Knight.)

A blast is impetuous; the exhalations of a trumpet, the breath of bellows, the sweep of

a violent wind, are blasts. A gust is sudden and vehement; gusts of wind are sometimes so violent as to sweep everything before them while they last. Storm, tempest, and hurricane, include other particulars besides wind. A storm throws the whole atmosphere into commotion; it is a war of the elements, in which wind, rain, and the like, conspire to disturb the heavens. Tempest is a species of storm which has also thunder and lightning to add to the confusion. Hurricane is a species of storm which exceeds all the rest in violence and duration. . . ." (Crabb: Eng. \*2. Fig.: The act of mixing different things together.

"I am not able to avouch anything for certainty, such a *brewing* and sophistication of them they make."—*Holland*.

II. Technically:

1. *Liquor manufacture*: The art of making beer. This term is also applied to the first operation of the distiller, viz., the extracting of the wort from grain, malt, or any other saccharine substance.

(1) *History*: According to Herodotus, the Egyptians made wine from barley. The Greeks learned the process from them, and, according to Xenophon, used a barley-wine. Tacitus informs us that beer was a common beverage among the Germans, and Pliny adds that it was so among all the nations of Western Europe.

(2) *Modern methods of operation*: In modern methods of brewing, the brewer is no longer confined to the exclusive use of malt and sugar, but is at liberty to make use of any material capable of being employed in the production of beer. The steadily increasing consumption of beer in the United States has not only revolutionized the manufacturing systems, but has developed brewing into a highly important industry. It is estimated that the yearly consumption of grain and hops in the breweries of the United States is of the value of more than \$50,000,000, while the amount of capital invested in the business is very large. Before the year 1866 the tax upon fermented beverages was collected in money at the rate of \$1 per barrel. Since then it is collected by means of revenue stamps. The consumption of beer in this country to-day is ten times as great as it was thirty years ago. There are six operations in brewing, viz., grinding or crushing, mashing, boiling, cooling, fermenting, and cleansing.

(i) *Grinding*: The malt or corn is bruised or crushed by smooth metal rollers, and left in a heap for a few days before brewing, by which it becomes mellow, and is more easily exhausted by the water in the mashing.

(ii) *Mashing*: The crushed or bruised malt is now thrown into the mash-tun, and water added at a temperature of from 158° F. to 172° F. After a maceration of three or four hours, assisted during the first half hour by constant stirring, the liquid portion is strained off through finely-perforated plates in the bottom of the mash-tun, into the underback, and pumped into the copper. In mashing, the aim of the brewer is, not only to dissolve out the sugar in the malt, but also to cause the so-called diastase contained in the malt to act on the starch and convert it into sugar. If the heat of the mash-liquor stands below 140° F., the diastase will be inactive; if above 185° F., it is apt to be destroyed. A medium temperature of 165° F. is found to be the most suitable for mashing.

(iii) *Boiling*: As soon as all the wort is collected in the copper, the hops are added, and the whole boiled for about three hours. The object of boiling is to coagulate and precipitate

the excess of albumen present, and to extract the aromatic oil and bitter of the hop.

(iv) *Cooling*: In order to prevent as much as possible the formation of acid, it is necessary to cool the wort as quickly as possible. This is done by exposing it to a current of air in large shallow vessels, or running it over refrigerating pipes.

(v) *Fermenting, or fermentation*: As soon as the temperature has fallen to 60° F. the wort is run into the fermenting vats, and yeast added. In about four hours fermentation begins, and is allowed to continue for forty-eight hours, when the yeast is skimmed off and the beer run into large casks. Fermentation is the most delicate operation of the brewer, as on it chiefly depends the quality and condition of the beer. His aim is, not to decompose all the sugar in the wort, but to leave a sufficiency to give body to the beer and keep up the evolution of carbonic acid gas.

(vi) *Cleansing*: The ordinary practice in cleansing is to run the liquid from the fermenting vats into a series of casks placed with their bung-holes slightly inclined, so that the yeast still generated may pass over into vessels placed to receive it. The object of cleansing is to check the action of the yeast. When sugar is used it is dissolved in the copper. The finished beer varies in specific gravity from 1.002 to 1.030, and contains from four to twenty-four per cent. of proof spirit, together with a sugar, called maltose, dextrine, colouring matter, and various salts.

**II. Law:** Bribery by a candidate or any agent of his at a parliamentary or municipal election voids the seat acquired through its aid. If it has been practised by the aspirant himself it incapacitates him from being elected again for a number of years. The extensive prevalence of bribery may be punished by the temporary or permanent disfranchisement of the corrupt place. Despite all efforts to prevent it bribery at elections is frequently practised, and there is every reason to believe that legislation is largely influenced by bribery of members of Councils and Legislatures, if not of Congress. The laws against this crime are stringent and the penalties severe, but it is very difficult to produce conviction of the offense.

**1. Arch.**: A moulded and burned block of tempered clay. The word is also applied to the block in its previous conditions, as a moulded plastic mass, and as a dried block in which the water, hygroscopically combined with the clay, is driven off. When this condition is accepted as a finality, the block so dried is an adobe. The burning of the previously dried brick drives off the chemically combined water, and for ever changes the character of the mass. An adobe may become re-saturated with water, and resume its plasticity; a brick may become rotten and disintegrated, but not plastic. *Arch-brick* is an iron grating the size of a brick, or a perforated brick, let into a wall to allow the passage of air. *Arch-brick* usually means the hard-burned, partially vitrified brick from the arches of the brick-clamp in which the fire is made and maintained. A *copying-brick* is one for the upper course of a wall; *clinker*, a brick from an arch of the clamp, so named from the sharp glassy sound when struck; a *copying-brick*, one for a coping course on a wall; *feather-edged brick*, of prismatic form, for arches, vaults, niches, &c.; *fire-brick*, made of intractable material, so as to resist fusion in furnaces and kilns; *hollow-brick*, with openings for ventilation; *stocks*, a name given to the best class of bricks, and also locally to peculiar varieties, as *gray-stocks*, *red-stocks*, &c. *Pecking, place, sandal, semi* brick, are local terms applied to imperfectly burned or refuse brick. Bricks vitrified by excessive heat are termed *burnt-bricks* or *burns*. (*Knights*.)

**2. Hist.**: Bricks were manufactured at a remote period of antiquity by the Egyptians, the Babylonians, the Assyrians, &c., and some of them being inscribed with written characters have been of priceless value in conveying historic facts to the present age. About A.D. 44 bricks were made in England by the Romans, and in A.D. 886 by the Anglo-Saxons under King Alfred. Under Henry VIII. and Queen Elizabeth the manufacture greatly flourished. The size was regulated by Charles I. in 1625.

1. *Ord. Lang.*: Clay used for making brick.  
"I observed it in pits wrought for tile and brick-clay."—*Woodward.*

2. *Geol.*: The term brick-clay occurs frequently in descriptions of Scottish geology, whilst the term used for the somewhat similar deposits in the valley of the Thames is *brick-earth*, or the pl. *brick-earths* (q.v.). Most of the Scottish brick-clays are of inter-glacial age, and some of them enclose arctic shells. Brick-clays, of excellent quality, are very abundant in many parts of the United States, and the City of Philadelphia is built upon a broad deposit of such material, the result, it is believed, of the grinding of rocks to clay during the glacial age.

(2) *Pl. (brick-earths)*: A term specially used of two beds or series of beds, the Upper and the Lower Brick-earths. The names were given by Mr. Searles Wood, jun. The latter are especially interesting. They exist near London at Ilford, Gray's Thurrock, Crayford, Erith, and Wickham. Besides freshwater and terrestrial shells, &c., they contain no fewer than twenty-four species of mammals, among others the Wolf (*Canis lupus*), the Beaver (*Castor fiber*), and the Wild Cat (*Felis catus*), a fossil horse (*Equus fossilis*), a Hyæna (*Hyæna spelæa*), and yet more remarkable *Elephas antiquus*, *primitivus* and *priscus*, *Rhinoceros tichorhinus*, *leptorhinus* and *megarhinus*, and *Hippopotamus major*. Prof. Boyd Dawkins considers them Pleistocene and Pre-glacial. He believes that in a descending order the following is the sequence of the several beds:—(1) Post-glacial deposits, climate severe, but gradually becoming temperate; (2) Glacial deposits, climate severe; (3) Lower Brick-earths of Thames Valley, climate comparatively temperate; (4) Forest bed of Norfolk, climate temperate. (*Q. J. Geol. Soc., xxiii. (1867) 91-109.*) Mr. Searles Wood, jun., on some points differs from Prof. Boyd Dawkins. (*Ibid., 394-417.*)

**brick-furnace, s.** A furnace for burning bricks. In Hoffmann's annular brick-furnace there is a central chimney and removable divisions for separating the annulus into different chambers. These are filled and emptied through doors. The chambers being charged with brick, heat is applied to one

chamber, and the volatile material thence resulting is led through the next one, so as to heat and dry the bricks in the next in series. The bricks in chamber one being burned, the fire is applied to number two, and so on to the end.

**brick-kiln, s.** [BRICKKILN.]

**brick-layer, s.** [BRICKLAYER.]

**brick-machine, s.** A machine for making bricks. Many such machines exist diverse in type from each other, patents for their construction in the aggregate amounting to hundreds, having been taken out in England or in the United States. In one of these, a patent clay-tempering and brick-making machine, invented in 1831 by Mr. Bakewell, of Manchester, the clay, after being tempered, is compressed into the proper form by a combination of levers. By Messrs. Cooke and Cunningham's machinery 1,800 bricks can be made in an hour. The making of bricks by hand is vanishing in the United States in consequence of the rapid and effective work done by machines. These machines are capable of turning out from 10,000 to 30,000 bricks in ten hours, varying considerably in their capacity and also in the quality of the work performed.

**brick-maker, s.** [BRICKMAKER.]

**brick-making, s.** The operations of brick-making may be said to consist in—Preparing the brick-earth, tempering, moulding, drying, and burning. The qualities of bricks may be thus enumerated:—Soundness, that is, freedom from cracks and flaws; hardness, to enable them to withstand pressure and strain; regularity of shape and size, to enable them to occupy their proper place in the course; infusibility, in those intended for furnace-work. *Fire-bricks* are made from a compound of silica and alumina, and the clay owes its refractory quality to the absence of lime, magnesia, potash, and metallic oxides, which act as fluxes. *Hollow bricks* are made for purposes of warming, ventilating, and removing moisture from the wall. In some cases the hollows form flues, or shafts for ventilation, or discharge of dust from the upper stories. In other cases the hollows have no mechanical function other than to form air-chambers for warmth, as it is well known that an imprisoned body of air is a very poor conductor of heat. (*Knight.*)

II. *Technically*:

1. *Arch.*: A structure consisting of an arch or series of arches supporting a roadway above it, designed to unite the two banks of a river or the two sides of an open space.

(1) *History of bridges*: Bridges seem to have existed in China from a period of considerable antiquity. The word bridge does not occur in the authorised version of the Bible. Temporary bridges, for military purposes, were constructed before permanent structures for the convenience of the inhabitants were erected. The former were often of boats. Thus Cyrus constructed such bridges about 536 B.C., Darius Hystaspes about 490, and Xerxes about 480 B.C. Bridges of stone or brick seem to have been first used by the Romans; there were none erected in Greece till after the Roman conquest. The first Roman bridge is said to have been one spanning the Tiber between the Janiculum and the Aventine Mountain, built by or under Ancus Marcius. Now they are universal in properly-civilised countries, though in countries of imperfect civilisation even yet they are few. In India they are not numerous, and most of those which exist have been erected since the occupation of the country by the British. London Bridge, in its oldest form, existed about A.D. 978, a new one was built of wood in 1014, yet another in 1209, and the present structure was completed in 1831. Old Westminster Bridge was opened in 1750, old Blackfriars in 1769, &c. In the United States bridge building has become a highly developed art, and numerous magnificent examples of it are to be seen. Of the Suspension Bridge, the most striking instance is that over the East River at New York. Of the newly adopted Truss Bridge system, Philadelphia has several fine examples, while of the Cantilever Bridges that at St. Louis is considered probably the finest specimen of bridge construction in the world.

(2) *Construction and parts of a modern bridge*: A bridge is generally made of wood, of iron, of stone, or of brick. The extreme supports of the arches at the two ends are called *abutments* or *abutments*; the solid parts between the arches *piers*, and the fences on the sides of the road or pathway *parapets*.

Crabbe thus distinguishes between brightness, lustre, splendour, and brilliancy: "Brightness is the generic, the rest are specific terms; there cannot be lustre, splendour, and brilliancy without brightness; but there may be brightness where these do not exist. These terms rise in sense; lustre rises on brightness, splendour on lustre, and brilliancy on splendour. Brightness and lustre are applied properly to natural lights; splendour and brilliancy have been more commonly applied to that which is artificial: there is always more or less brightness in the sun or moon; there is an occasional lustre in all the heavenly bodies when they shine in their unclouded brightness; there is splendour in the eruptions of flame from a volcano or an immense conflagration; there is brilliancy in a collection of diamonds. There may be both splendour and brilliancy in an illumination: the splendour arises from the mass and richness of light; the brilliancy from the variety and brightness of the lights and colours. Brightness may be obscured, lustre may be tarnished, splendour and brilliancy diminished. The analogy is closely preserved in the figurative application. Brightness attaches to the moral character of men in ordinary cases, lustre attaches to extraordinary instances of virtue and greatness, splendour and brilliancy attach to the achievements of men. Our Saviour is strikingly represented to us as the brightness of His Father's glory, and the express image of His Father's person. The humanity of the English in the hour of conquest adds a lustre to their victories which are either splendid or brilliant, according to the number and nature of the circumstances which render them remarkable." **brome-grass, s.**

*Bot.*: The English book-name for the genus *Bromus* (q.v.).

**brō-mēl-ī-a**, *s.* [In Fr. *bromélie*. Named after Bromelias, who published a Gothic flora.]

*Bot.*: A genus of plants, the typical one of the order Bromeliceæ (q.v.).

**brō-mēl-ī-ā-ŕ-œ-se**, *s. pl.* [From Lat., &c. *Bromelia* (q.v.); and Lat. fem. pl. adjectival suffix *-aceæ*.]

*Bot.*: Bromeworts, a suffix of endogenous plants, placed by Dr. Lindley under his Narcissal Alliance. The calyx is sometimes herbaceous-looking, but sometimes coloured. Petals, three, coloured; stamina, six or more; ovary, three-celled, many-seeded, as is the fruit, which is capsular or succulent. The stem is wanting or, if present, very short. Sometimes it consists of fibrous roots, consolidated round a slender centre with rigid channeled leaves spiny at the edge or point. The fruit is sometimes eatable. In 1847 Lindley estimated the known species at 170, all from America, whence they have migrated to Africa, the East Indies, and elsewhere. The well-known pine-apple is the *Bromelia Ananas*. [ANANAS, PINE-APPLE.] Ropes are made in Brazil from another species of the same genus. All the species of Bromeliceæ can exist without contact with the earth; they are therefore suspended in South America in houses, or hung to the balustrades of balconies, whence they diffuse fragrance abroad.

**brō-mēl-wōrts**, *s. pl.* [From Lat. *bromelia*, and Eng. *wort*.]

*Bot.*: The English name given by Lindley to the natural order Bromeliceæ.

**brōm-hŷ-dri-āns**, *s. pl.* [From Eng., &c. *bromine*]; *hydr(ate)*; and suffix *-in* (*Chem.*) (q.v.).

*Chem.*: Haloidethers formed by replacing the 1, 2 or 3 (OH) radicals in the triatomic alcohol glycerin by Br. Monobromhydrin  $CH_2Br-CH(OH)-CH_2(OH)$ , an oily liquid boiling at 130°, obtained by the action of HBr on glycerin  $C_3H_7(OH)_3$ . Symmetrical Dibromhydrin,  $CH_2Br-CH(OH)-CH_2Br$ , a liquid boiling at 219°, obtained by the action of bromine on monobromhydrin. Unsymmetrical Dibromhydrin  $CH_2Br-CHBr-CH_2(OH)$ , boiling at 212° by the action of bromine on silyl alcohol ( $H_3Si = CH-CH_2(OH)$ ). Tribromhydrin or Allyltribromide  $CH_2Br-CHBr-CH_2Br$ , a crystalline substance melting at 16°, and boiling at 220°; it is obtained by the action of excess of bromine on silyl iodide. [CHLORHYDRINS.]

**brō-mīc, a.** [From Eng., &c. *bromine*], and suffix *-ic*.] Pertaining to bromine; having bromine in its composition.

**bromic acid, s.**

*Chem.*:  $HBrO_3$ . A monobasic acid, forming salts called bromates. When bromine is dissolved in caustic potash a mixture of bromide and bromate of potassium is obtained, which can be separated by crystallisation,  $3Br_2 + 6KHO = 5KBr + KBrO_3 + 3H_2O$ . Free bromic acid can be prepared by passing chlorine into bromine water,  $Br_2 + Cl_2 + 2H_2O = 2HBrO_3 + 10HCl$ . The acid is best obtained by decomposing potassium bromate by argentic nitrate acid acting on the resulting argentic bromate by bromine,  $5AgBrO_3 + 3Br_2 + 3H_2O = 5AgBr + 6HBrO_3$ . Bromic acid is a strongly-acid liquid, reddening and then bleaching litmus paper. On concentration at 100° it decomposes into bromine and oxygen. It is decomposed by sulphur dioxide ( $SO_2$ ), sulphide of hydrogen ( $H_2S$ ), and by hydrobromic acid (HBr). Bromates are with difficulty soluble in water, and are decomposed on heating into oxygen and bromides.

**bromic silver, s.**

*Min.*: The same as Bromyrite and Bromargyrite (q.v.).

**brō-mīde, s.** [Eng. *bromine*]; *-ide* (*Chem.*) (q.v.).

*Chem.*: A combination of bromine with a metal or a radical. Bromides are soluble in water, except silver and mercurous bromides; lead bromide is very slightly soluble. They are detected in analysis by the following reactions:—Argentic nitrate gives a yellowish precipitate of AgBr, insoluble in dilute nitric acid, and soluble in strong ammonia. Chlorine liberates bromine, and, if the liquid is shaken up with ether, a yellow ethereal solution floats on the liquid. Heated with sulphuric acid and  $MnO_2$ , bromides yield vapours of Br, which turns starch yellow.

† *Bromide of silver, Bromid of silver:*

*Min.*: The same as Bromyrite (q.v.).

**brō-mīn-ā-tēd, a.** [Eng. *bromine*]; *-ated*.] Combined with bromine (q.v.).

"Water and its chlorinated and brominated congeners."—*Foerster: Chem.* (ed. 1873), p. 94.

**brō-mīne, s.** [From Gr.  $\beta\rho\omicron\mu\omicron\varsigma$  (*bromos*) = a stench; Mod. Lat. *brominum*.]

*I. Chem.*: A non-metallic element. Symbol, Br; atomic weight, 80. Bromine was discovered in 1826 by Balard in the salta obtained by the evaporation of sea-water. Bromine is liberated from the sodium and magnesium salts by the action of free chlorine, and is separated by ether, which dissolves the bromine. This red-coloured solution is removed, saturated with potash, evaporated, and heated to redness, and the bromide of potassium is heated with manganese dioxide and sulphuric acid. The bromine is liberated in the form of a deep-red vapour, which condenses into a dark, reddish-black liquid. Sp. gr. 2.97; it boils at 63°; its vapour density is 5.84 times that of air. It has an irritating smell, and when inhaled is poisonous. It dissolves in thirty parts of water, and the solution has weak bleaching properties. Bromine and hydrogen do not unite in the sunlight, but do when they are passed through a red-hot porcelain tube, forming hydrobromic acid (HBr), which is also obtained by the action of phosphorus and water on bromine. It is a colorless, fuming gas, which liquefies at 73°, very soluble in water. The concentrated solution contains 47.6 per cent. of HBr; it boils at 126°, and has powerful acid properties; it neutralises bases, forming bromides and water. Hypobromous acid,  $HBrO$ , is only known in solutions; it has bleaching properties. Bromine can displace chlorine from its compounds with oxygen, whilst chlorine can liberate bromine from its compound with hydrogen. Free bromine turns starch yellow.

*2. Pharm.*: Bromine has been applied externally as a caustic, but rarely. Its chief official preparations are bromide of ammonium, useful in whooping-cough, infantile convulsions, and nervous diseases generally; and bromide of potassium, now very extensively used, especially in epilepsy, hysteria, delirium tremens, diseases of the throat and larynx, bronchocele (Goitre), enlarged spleen, hypertrophy of liver, fibroid tumours, &c. Also, as an antaphrodisiac, for sleeplessness, glandular swellings, and skin diseases. Its alternative powers are similar to but less than that of the iodides. Its preparation is the same as iodide of potassium, substituting an equivalent quantity of bromine for iodine— $6KHO + Br_2 = 5KBr + KBrO_3 + 3H_2O$ . It has a pungent saline taste, no odour, and occurs in colourless cubic crystals, closely resembling the iodide. As a hypnotic its usefulness is much increased by combining it with morphia and chloral hydrate.

**brōn-chī-ēc'-ta-sis**, *s.* [From Gr. βρόγχος (brōngchos) = the windpipe, and ἐκτασις (ektasis) = extension; ἐκτείνω (ekteinō) = to extend; ἐκ (ek) = out, and τείνω (teino) = to stretch.]

*Med.*: Dilatation of the bronchi. [BRONCH.] The most important forms are:—(1) The general or uniform, with cylindrical or fusiform dilatation of a tube, or several tubes; (2) The sacular or ampullary (ΑΜΦΥΛΛΗ), in which there is abrupt dilatation of a tube at a particular point or points. The breath and sputum are fetid, and general health impaired, followed by lung consolidation, ulceration, abscess, or gangrene. Death may result from exhaustion, but recovery may take place by formation of a sort of fibrous capsule, or from penetration of the contents outwards. Bronchiectasis is not uncommon, and is of interest and importance on account of its alliance with some forms of phthisis.

**brōn-chī-tis**, *s.* [Gr. βρόγχια (brōngchia) = the bronchia, or βρόγχος (brōngchos) = the bronchus or windpipe (q.v.), and Γρις (itis) (Med.), denoting inflammation.]

*Med.*: Inflammation of the air-tubes leading to the pulmonary vesicles, accompanied by hoarseness, cough, increase of temperature, and soreness of the chest anteriorly. The natural mucous secretion is at first arrested, but increases afterwards, and is altered in quality, becoming more copious. Its forms are:—(1) Acute bronchitis, (a) of the larger and medium-sized tubes; (b) capillary bronchitis, and bronchitis of the tubes generally—the *peri-pneumonia notha* of the older writers. (2) Chronic bronchitis. (3) Plastic bronchitis. (4) Mechanical bronchitis, such as knife-grinder's disease—carbonaceous bronchitis or black phthisis. (5) Bronchitis secondary to general diseases, such as measles or typhoid fever. (6) Bronchitis secondary to blood diseases. (7) Syphilitic bronchitis. All varieties are generally preceded by feverishness, but often by "a cold in the chest." The uneasy sensations begin about the region of the frontal sinuses, passing from the nasal mucous passages, trachea, and windpipe to the chest, with hoarseness, cough, and expectoration; but in capillary bronchitis the cough is dry and without expectoration. In acute cases the sputum is first thin, then opaque and tenacious, lastly purulent; the breathing is hurried and laborious, the pulse quickened, and the skin dry. The danger increases in proportion as the finer bronchial tubes become involved, and instead of the healthy respiratory sound we have sharp, chirping, whistling notes, varying from sonorous to sibilant. The sharp sound is most to be feared, as arising in the smaller tubes; the grave, sonorous notes originate in the larger tubes. Spitting of blood sometimes occurs, and in severe cases persons actually die vomited from the immense quantity of mucus thrown out obstructing the tubes and causing collapse of the vesicular structure of the lungs. The ratio of the respiration to the pulse is high, going up to 60 or even 70 in the minute, with a pulse-rate of 120 or 130. Chronic bronchitis, or bronchial catarrh, is extensively prevalent, especially among the aged, recurring once or twice a year in spring or autumn, or both, till it becomes more or less constant all the year round.

(2) *Characters, properties, and uses*: Bronze, as already stated, is an alloy of copper and tin. It is harder and more fusible than copper itself. The proportions of the two constituents vary according to the purpose for which the alloy is produced. The bronze for cymbals is composed of 78 parts of copper and 22 of tin, that for cannon 100 parts of copper

fate, fāt, fāre, amidst, whāt, fāll, father; wē, wēt, hēre, camel, hēr, thēre; pine, pīt, sīro, sir, marine; gō, pōt, or, wōre, wōlf, wōrk, whā, sōn; mūte, oūb, cūre, unite, cūr, rīle, fūll; try, Sŷrian. æ, œ = ē. ey = ā. qu = kw.

to 11 of tin, that of ordinary bell-metal about 8 of copper, 101 of tin, 5% of zinc, and 43 of lead, and that used in bronze coins 95 parts of copper, 4 of tin, and 1 of zinc. Its average density is 8.4. It oxidises very slowly, even when the air is moist, which renders it well-adapted for statues and similar works of art.

B. As adjective: Made of bronze, characterized by the presence of bronze in a literal or figurative sense.

bronze age, s.

1. Archaeol.: The age of bronze, the second of three ages believed by M.M. Nilsson, Steenstrup, Forchhammer, Thomsen, Worsaae, and other Danish archeologists to have followed each other in the peninsula of Jutland and elsewhere in the following order:—(1) The stone age, (2) the bronze age, and (3) the iron age. During the first stone, or sometimes bone, was used for weapons and implements, the working of metal being as yet unknown. Then weapons were made of bronze, the method of alloying the two metals having been discovered, but that of working in iron being undiscovered. Finally iron took the place of bronze. These views have been generally adopted by geologists and archeologists, though some believe an age of copper to have intervened between those of stone and bronze. The allegation that the use of stone came first, that of bronze next, and that of iron last, is not inconsistent with the fact that all still exist contemporaneously in portions of the world.

During the age of bronze the oak was the dominant tree in Denmark, the Scotch-fir, now extinct in that country, having flourished during the earlier part of the stone age; while the beech was and remains the characteristic tree of the iron age. Lake-dwellings of the bronze period have been found in western and central Switzerland, and one has been discovered in the lake of Constance. Geologically even the stone age belongs only to the recent period. (Lubbock, Lyell, &c.)
